### PREFACE.

The object of the present publication, and an explanation of the data, from which the Tables have been computed, are set forth in the "Introduction."

It was originally the Author's intention simply to publish a few Tables, with practical examples, illustrative of their application; but, in working out the examples, it occurred to him that it would not be unacceptable to those who take an interest in the subject, but who are not familiar with the theory of Annuities and Assurances, if he were also to explain, without using any Algebraic symbols, the principles upon which the Tables were constructed. This he has endeavoured to accomplish.

To those persons, therefore, who are acquainted with decimal arithmetic, the author thinks that they would find in the "Examples" an "Elementary Treatise" on Annuities and Assurances, which would be of considerable service to them by way of preparation for the study of the larger and more comprehensive treatises by Milne, Bailey, and D. Jones.

The whole of the computations made from the "New Rate of Mortality," have been carefully calculated by two separate computers.

In the construction of some of the Tables, the

Author is indebted to Mr. Joseph J. Cleghorn, the efficient Deputy to Mr. Griffith Davies, the Actuary of the Guardian Assurance Company, who had previously computed them for the use of his own office, and which, upon comparison, were found to agree in every respect with those computed by the Author.

The Author is also indebted to Mr. Griffith Davies' step-son, Mr. Evan Owen Glynne of the Legal and General Life Office, whose services he was fortunate enough to obtain, and by whom the greater portion of the calculations were made in Duplicate with the Author.

The Legal Decisions were compiled by the Author's friend, Mr. Hugh Owen, of the Poor Law Commission Office.

The Author had intended to print, by way of Appendix, a Popular Exposition of the Principles of Assurance, with observations upon the various "advantages" held out by the several Life Offices, and a comparison of their rates of premium, &c., but it has been suggested to him that it would be desirable to make a separate, and a very cheap publication of it, which the author purposes doing at a future opportunity.

National Mercantile Life Assurance Society, December 21, 1843.

## INTRODUCTION.

The institution of Life Assurance Societies is generally admitted to be one of the most important and benevolent features in modern civilization: and it must be gratifying to all who take an interest in the welfare of society and in the happiness of their species, to observe the great increase which has taken place in the number of these institutions so far as that fact may be taken as an indication of the increase in the numbers who have availed themselves of their advantages. The great danger, however, is that by over competition parties may be (as some have been) induced to charge premiums which are too low to cover the risks incurred, and thus be productive of the very mischief which it is ostensibly their object to prevent.

The great importance of the subject will be manifest when it is considered that thousands of persons are annually investing a large portion of their income to provide subsistence for their families, in the event of their own premature death, and that a very large portion of the property of the country is dependent upon the tenure of humanlife, so that the welfare and future happiness of a large part of the community are entirely dependent upon the solvency of these institutions. It is therefore of the first importance that the tables of rates should be calculated from the most recent and most extensive experience that can be obtained; so that, on the one hand, they should not be exorbitant; yet, on the other, that they should be *fully adequate* to cover the risks, and to meet all the liabilities incurred.

To determine the premiums, single or periodical, which ought to be charged for any description of assurance, it is first necessary to construct a table of mortality—that is, a table exhibiting out of a certain number born or who complete a given age, say 100,000, the number who die in each year of age, from birth, or the given age to the extreme of life. It is by means of such a table, combined with the interest of money, that the premiums charged by Life Offices are determined.

The earlier societies, such as the Amicable, and Royal Exchange, which were established in the 17th century, it appears, charged a premium of £5 per cent., on all lives assured without reference to age; but it is needless to add that they have since adopted proportionate rates for the risk of each age; and in the absence of better materials the premiums charged by the Equitable Life Office were deduced

from the probabilities of life in London during a period of 20 years, which included the year 1740, when the mortality was considered to be almost equal to that of a plague. These premiums, however, were not deemed by the then Attorney-General to be sufficiently high, and the Crown, in consequence of his recommendation, refused to issue a charter, which naturally retarded very materially the progress of the society.

In the year 1776, however, the premiums were reduced 1-10th, and in 1780, Dr. Price's Northampton Table was adopted as the basis upon which a fresh set of rates was calculated, to which 15 per cent. was added for further security. This, however, was taken off in 1785, and the premiums from that date to the present have remained unaltered.

The Northampton Table was formed by Dr. Price from bills of the mortality during the years 1735 to 1780, in the parish of All Saints, Northampton, which contained little more than half the population of that town, and on the supposition of a stationary population, whereas the population was then increasing. It is manifest that a rate of mortality so obtained and deduced from the experience of one parish could not be taken as an index of the mortality throughout the kingdom, which contains upwards of 12,000 parishes. This, however, is the table used by the majority of the old Life Offices, and by some of the new, although it has apparently been proved, at least by the experience

of the Equitable, to represent the mortality much too high, especially at the younger and middle ages.

This will be seen by the following table extracted from Mr. Morgan's "View of the rise and progress of the Equitable Society," which shews the number who died in the 12 years preceding 1829, out of a certain number of assurances in force, and contrasts that number with the number that they had reason, according to the Northampton rate to expect to have died in that period.

Various other tables of mortality have been constructed since the Northampton: of those of most note the first is the Swedish, which was constructed from returns collected in the years from 1755 to 1776, inclusively, and which contained the whole population of Sweden and Finland. This Table has been since corrected from more recent data. The next is a table by Mons. De Parcieux exhibiting the mortality amongst the nominees of the French Tontine. The more recent tables, and those now generally used are the Carlisle and Equitable rates of mor-

tality. The Carlisle was framed by Mr. Milne, from observations made by Dr Heysham, of the mortality in that town during the years 1779-1787, upon a population of 8,000 persons. The "Equitable" was framed by Mr. Griffith Davies, from the decrements of life among the members at the Equitable, and subsequently by Mr. Morgan, from more complete data, so that Mr. Davies' table can now only be considered as a graduated Carlisle.

The Carlisle table agrees very closely with the Equitable, but independently of the objection to a table based upon so few observations, it will be found, notwithstanding its close agreement with the Equitable experience, that for the want of a greater number of observations at each age, and the table not being graduated, but confined strictly to the data afforded at each age, the Carlisle is impracticable as a basis for temporary assurances, for, on account of the irregularities in the probabilities of dying in one year at several of the ages, the premiums deduced therefrom would, in some instances, be greater for young lives than for old ones. example—at 45 the premium to assure £1000 for one year would be £14 8s. 0d., and at 50 it would be £13 0s. 0d. The irregularities in the probabilities would also affect survivorship assurances, as the probability of surviving one year is an important element in the calculation of those contingencies.

Mr. Milne states that the Carlisle table differs very little from the general law that obtains throughout

the country, taking town and country together. But supposing the Carlisle, or any other table, to represent accurately the mortality of the united kingdom, such a rate ought only to be used in the absence of the actual experience of the mortality amongst assured lives, for offices do not take lives indiscriminately, but have the power of selection. Now if an office is prudently conducted, all doubtful lives are rejected; and if it were possible to select all good lives such a table as the Carlisle would manifestly represent a mortality higher than that which would prevail amongst the lives actually assured. As there is also greater laxity in the selection of lives in some offices than in others, and as it will happen, even with the utmost vigilance exercised, that some unsound lives will be passed as eligible, it is manifest that a rate of mortality, deduced from the combined experience of the various Life Offices, is the most consistent, and the safest basis upon which the rates of assurance ought to be determined.

Mr. Griffith Davies, the able and experienced Actuary of the Guardian Life Office, in his observations upon the data afforded by the Equitable observes,—"It must be allowed that however doubtful the limited experience of a new institution might be regarded, the proportions stated by Mr. Morgan, repeated and confirmed as they have been for a period exceeding half a century, afford more satisfactory data for determining the rate of mortality among assured lives, than any registers hitherto made public."

Mr. Babbage, in his "Comparative view of the various Institutions for the Assurance of Lives," says, in reference to the best data for constructing a rate of mortality, that "It is, therefore, to be expected that the law of mortality which exists amongst assurers, should approach more nearly to that which takes place amongst select classes of mankind, such as amongst annuitants, (where it is the interest of each proprietor to select a good life) than to more indiscriminate bodies of people. Although there exist good observations of this kind, I am not aware of their having been employed as the basis of any table of premiums for assurances."

"Having now pointed out the defects of the tables in general use, it will naturally be inquired what others it is proposed to substitute. To this it may be answered, that the best substitution would be a table actually constructed from the deaths occurring amongst a large body of persons of this very class whose law of mortality we wish to ascertain. Materials for such a table exist, and probably in the best and most authentic form. The Equitable Society has been established sixty years, and it must possess records of the death, and cause of death, of all those who have had claims on its funds. Another society of considerable extent, the Amicable, has existed above a century, a vast quantity of valuable materials is, without doubt, contained in the records of these two societies, and if they were each to communicate to the public the facts of which they

are in possession, it would form a most important addition to our knowledge, and supply the most accurate materials for tables of this class which have yet been produced."

By the liberality of several of the Life Offices, and the disinterested zeal and services of a Committee of some of the most experienced and eminent of the Actuaries, we have now data for the construction of a rate of mortality, not simply of the experience of the Equitable and Amicable, but of the combined experience of no less than 17\* Life Offices, embracing 83,905 policies, and a rate of mortality has been adjusted by one of the most eminent Mathematicians on the Committee, from the combined town and country experience, embracing 62,537 assurances.

It is a very common practice with some of the offices to announce their premiums as having been computed by an able Mathematician from the most recent and most extensive experience, without usually stating what such experience is, or giving the name of the able Mathematician, who is thus alleged to have constructed their tables. As, however, we have now very recent and extensive experience of the

<sup>\*</sup> It may not be amiss here to observe that 13, out of the 17, contributing offices are proprietary companies, who would thus appear to be animated by motives equally as disinterested as those of the "Equitable" and "Amicable," who, as Mr. Babbage observes, "have no private interests to oppose their publishing for the advancement of science, the results of that experience which it alone, by securing their stability, has enabled them to acquire, thus supplying the solid materials of further improvements, which must inevitably reflect back the greatest advanages on those most largely engaged in such transactions."

mortality amongst assured lives, such as ought to form the basis upon which all rates shall in future be calculated, it may be useful to explain the origin of the Committee, and the course adopted by them in their collection and employment of the data contributed by the several offices.

The Committee was formed at a Meeting of Actuaries, and others connected with Life Assurance Offices in London, held at the London Coffee-House, Ludgate Hill, on Monday the 19th March, 1838, at which it was resolved unanimously:

"That in the opinion of the meeting, it is desirable that the different Assurance Offices, should from their records contribute the requisite data to the common fund, to afford the means of determining the Law of Mortality which prevails among Assured Lives.

"That such a Law of Mortality, truly determined, would prove generally useful, especially to the Life Offices themselves, and the numerous class of persons availing themselves of those Institutions.

"That persons professionally engaged in similar investigations, are most likely to draw correct conclusions from existing data, and to classify the same into forms, showing the true rate of mortality among Assured Lives."

The following particulars were obtained from the offices that engaged to contribute their experience:—

| For use of | r use Current Year of Age at |        | r of  | If by<br>Death, | Sex, if<br>Female | Distinc-<br>tion into<br>Town, T. |        | Special<br>risks and |

|            |                              |        |       |                 |                   |                                   |        |                      |
|            |                              |        |       |                 |                   |                                   |        |                      |
|            |                              |        |       |                 |                   |                                   |        |                      |

The following circular, which was transmitted with a supply of forms to each of the contributing offices, will explain the particulars that were obtained from them:—

1, King William Street, City, 25th September, 1838.

SIR,

- "The Committee of Actuaries desire me, in forwarding the accompanying forms, which they have prepared for collecting the data, on which to found the experience of Assured Lives generally, to submit the following explanation of the nine columns into which the forms are divided.
- "Column 1.—Headed 'For use of Office,' is intended for the number of the policy, or any other distinguishing mark, by which the person employed to make the extract from the Policy Register, may note how far he has proceeded, and be enabled to resume the operation without difficulty.
- "Column 2.—Headed 'Current Age at Entry' is intended to contain the age next birth day of the party Assured, at the time the Assurance was effected.
- "Column 3.—Headed 'Year of Entry' is for the Year in which the Assurance was effected. The Committee require neither the month, nor the day of the month. The same observation applies to column 4, headed 'Year of Exit.' No distinguishing mark is required to show whether a Policy has become extinct by forfeiture, purchase, or expiration of term; but when extinguished by death, a D must be inserted in the next column, No. 5. The column marked 'Exit' will be left blank, opposite all those Policies which were in force on the 31st December, 1837, to which date it is requested that the list be made up, if convenient.
- "The next column is for distinguishing the sex, in which is to be put an F opposite all Policies on the lives of Females; the blanks will indicate Males. Such Offices as have Agents are requested to insert a T opposite those Policies effected in Town;

a C opposite to those Policies effected in the Country, and an I opposite those effected in Ireland, in the column marked 'Distinction into Town, Country, and Irish.'

"The cause of death is to be inserted in the next column, in a line with those Policies extinguished by death.

"The last column is intended for a notice of special or foreign risks, and for the insertion of any observation that may be considered useful.

"The question of founding the experience from returns of Policies issued, or on Lives Assured, was fully discussed by the Committee,—to confine the returns to a list of the Lives Assured in each Office might at first appear desirable, as a means of avoiding the insertion of the same Life more than once, in cases where more than one Policy has been granted thereon; but when it was considered that in combining the returns of several Offices, it would be impossible to prevent the repetition of the same life, as many are assured in several Offices, and that, in combining large numbers where Lives represented by duplicate Policies, are subject to the same ratio of mortality as those represented by single Policies, the result cannot be sensibly affected by the duplication, it was determined by the Committee to confine the lists to a record of Policies issued on single Lives."

I have &c.

Robert Christie, Hon. Sec.

From the returns received from the several offices in the prescribed form, and which were blended together as they came in, "so as to prevent any use being made of the returns separately," various tables have been prepared, and great care appears to have been exercised in the classification of the data, upon which the results in the tables have been obtained.

The following is a list of the several tables,\* prepared by the committee.

Table A (1-6)—Shewing out of the number of Assurances effected in each current year of age, the respective numbers in each year of duration, cancelled by discontinuance and by death, and existing at the termination of the observations. (Separate tables for Male and Female lives, Town, Country, and Irish respectively.)

Table B (1-6)—Being an enumeration of entries, existences, discontinuances, and deaths, in each year of age, deduced from the foregoing tables, A (1-6) (separate tables for Town, Country, and Irish Male and Female lives respectively.)

Table C.—Shewing the number exposed to the risk of mortality, the actual number of deaths for Assurances on the lives of Males and Females, separately and collectively, and for Town, Country, and Irish Assurances separately, deduced from Tables B and the computed number of deaths, according to the Northampton, Carlisle, and Mr. Davies's Equitable Tables of mortality, in decennial periods of age, calculated to the nearest whole number.

Table D. (1-5)—Shewing the number exposed to the risk of mortality, and the deaths in each year, with the probability of surviving one year, and the expectation or average duration of life; deduced from Tables B (1-6) (for Town, Country, and Irish Male and Female Lives separately, and for Town, Country, and Irish experience separately.)

Table E.—Shewing four times the number exposed to the risk of mortality, and four times the number of deaths in each year, with the probability of surviving one year, and the expectation or average duration of life, deduced from Tables B (1) B (4) and other Town experience, which together comprise 48,702 Assurances.

Table F.—Shewing four times the number exposed to the risk

<sup>\*</sup> These Tables are not published, and are only in the possession of the several Life Offices who subscribed for copies.

of mortality, and four times the number of deaths in each year with the probability of surviving one year, and the expectation or average duration of life; deduced from the total experience, which comprises 83,905 Assurances.

Table G.\*—Adjusted law of mortality, according to the combined Town and Country experience, deduced from Tables D, (4) and E, which comprise 62,537 assurances.

Equitable experience for separate classes.

Table H (1)—Shewing results on 7,259 lives admitted between the ages of 25 and 35 years.

Table H (2)—Shewing results on 6,270 lives admitted between the ages of 35 and 45 years.

Table H(3)—Shewing results on 3,436 lives admitted between the ages of 45 and 55 years.

Table H (4)—Shewing results on 1,317 lives admitted between the ages of 55 and 65 years.

Table I(1)+—Shewing the expectation or average duration of life; deduced from eight original Tables, and compared with the Northampton and Carlisle Tables.

Table I (2)—Shewing the expectation or average duration of life, for persons admitted at particular ages in the Equitable Society, and compared with Mr. Morgan's and Mr Davies's Tables of that Society's total experience.

Table K.—Shewing the mortality per cent. in each year of age; deduced from twelve original Tables.

Table L.—Shewing the annual number of deaths in quinquennial periods of age, out of 10,000 persons living at each age according to various Tables of mortality.

It appears to have been originally the intention of the Committee "to put the various offices, and those who might be interested in carrying out such investigations, in possession of what appeared to be the most useful and valuable classifications of the bare

<sup>\*</sup> See Tables 5, 6, and 7. + See Table 8.

facts comprised in the different returns, without the introduction of any arbitrary or theoretical adjustments. However, as some persons might be desirous to see an adjusted table of mortality, one has been deduced from the combined-Town united with the Country Assurances, which comprise the whole of the male and female lives that admit of being separated from the Irish."

It would have been interesting to have had a classification of the causes of death amongst assured lives, but it appears that "the returns of the causes of death were deficient in so many of the lists that it was not considered desirable to make any classification of them."

The Author has examined the whole of the Tables with great care and with much interest, but prefers setting forth the peculiar features exhibited by them in the language of the Committee in whose praise too much cannot be said for the valuable time and trouble which they have gratuitously given to this important and interesting subject.

The Committee state that the most striking features exhibited in these Tables, are the great mortality that prevails among Irish lives, and the marked difference in the rate of mortality between males and females. The near agreement with each other of the Tables for "Town" and "Country" Assurances is also very remarkable, considering that no adjustment has been employed.

On comparing the results given in tables C and

L, the mortality annually, taking all ages together, is shown to be least amongst "Town" Assurances, rather more amongst "Country," and greatest amongst "Irish" Assurances. The mortality amongst assured females, taking all ages together, is also greater than amongst assured males; and both these classes exhibit a greater rate of mortality than either "Town" or "Country" Assurances, which arises from the Irish Assurances being included amongst the males and females.

The mortality represented in table C, is considerably greater for females than males, between the ages of 20 and 50, from 50 to 70 years of age it is less, and after the latter age it is at some periods rather greater, but the numbers are too small to be of any import at these advanced periods of life. The "Irish" Assurances are subject to rather less mortality under 60 years of age than is represented by the Northampton Table; but after that age the mortality amongst them is greater: and taking all ages together, the deaths are more than 95 per cent. of what might be expected by that table.

On making a comparison of the different classes according to the expectations of life, as shewn in Table I, it will be seen that the average duration of male lives, under 36 years of age, is greater than that of females, and from 36 to 61 years of age, the average duration of the lives of females is greater than that of males, but after the age of 61, the expectation is greater for males than females, which

may arise from the paucity of numbers at the advanced periods of life. The expectation of life for the class designated "Town" (deduced from the facts contained in Table A), will be found to agree very nearly with Mr. Morgan's Equitable Table E, being a little more, but scarcely differing one with another a quarter of a year from 22 to 63 years, after the latter age the expectation of life is sometimes a little more and sometimes less than by Mr. Morgan's Table, but on the whole exhibiting a close agreement. The "Irish" class gives a considerably less expectation of life than Mr. Morgan's Table at all ages; and after the age of 44, the expectation is even less than by the Northampton Table. The class designated "Combined Town" in which the "Equitable" and "Amicable" total experiences are combined with the other "Town" Assurances, will be found to give the expectation of life rather less than the latter, arising doubtlessly from the assurances in the two offices just named being of longer duration than those in most of the other offices. The expectation of life, deduced from the whole of the materials put together, it will be seen differs very little from the "Combined Town," The four classes "Town," "Country," "Combined Town," and "General," will be found to agree very closely with the expectations of life deduced from Mr. Milne's Carlisle Table of Mortality, although generally giving a lower expectation than that Table."

In reference to the materials from which the

whole of the Tables have been formed, the Committee state that they represent a lower rate of mortality than can be expected to prevail in a longer period of time than that over which the present observations extend; for the average duration of Policies embraced in nearly one-half of the experience is under  $5\frac{1}{2}$  years; and taking the whole of the experience together, which includes that of the "Equitable" and "Amicable," the two oldest offices existing, the average duration of all the Policies is not  $8\frac{1}{2}$  years. This is readily accounted for when it is seen that more than half the Policies effected were existing at the termination of the observations, and nearly a third had been discontinued during the life time of the parties assured. The circumstance of recent selection should not be lost sight of by such persons as may use these Tables either for the sake of comparison or as the basis of other tables for granting assurances. The difference in the rate of mortality between recently selected lives and those of longer continuance in the society is clearly shewn by Mr. Galloway in the tables of mortality deduced by him from the experience of the "Amicable Society," and which that society, like the "Equitable," has recently so disinterestedly printed for the use of its members."

It has been thought right to enter thus fully into the origin of the publication of the Tables, prepared under the superintendence of the Committee of Actuaries, and to set forth their opinion of the results obtained by them, as it is of the utmost importance that the public should be made acquainted with the fact that such a committee has been formed, and have availed themselves of the most extensive and special experience that could be obtained to determine the law of mortality which prevails amongst assured lives, and have thus enabled every existing office to test the adequacy of its rate of premiums, and future offices to provide a rate for themselves on a secure basis.

A rate of mortality having been determined, the next important point for consideration is the rate of interest which must be assumed, as that which the funds invested by a Life Office will realize. Those offices which have started at considerably "lower premiums than any other office," justify the reduction in their rates on the ground of the mortality not being so great as that represented by the tables of mortality used generally by the offices, and also that they can realize a larger per centage on the monies invested, than that on which the rates are generally based. The mortality deduced from the combined experience of the various Life Offices will set all speculations at rest as to the rate of mortality which may be expected to prevail amongst assured lives. With respect to "Interest," it will be admitted, at least, that it is liable to great fluctuation, and that money has been for a series of years gradually lessening in value. Mr. De Morgan

"We are already in a very different position as to the rate of interest which has been gradually falling since the war. \* \* \* Assuming the necessity of calculating upon a rate of interest something less than that which can actually be attained, I should think that no office would be justified in supposing more than 3 per cent., with tables which are sufficiently high to come any ways near to the actual experience of mortality. With regard to one point, and that of fundamental importance, namely, the possibility of a still further fall in the rate of interest, it may even be doubted whether, with such tables, a still lower rate of interest should not be allowed."

But it is urged by the cheap offices, "Oh, but we have a large protecting capital," which protecting capital, as Mr. De Morgan justly remarks, would, "if the premiums were really too low, be an injury and not a benefit, for since this capital is really paid for in whole or in part out of

premiums, it would not preserve the office from insolvency, but would rather accelerate its progress towards bankruptcy."

It is needless to observe that proprietors of Life Offices do not embark their capital to make up an anticipated deficiency, but like other investments, their capital is sunk with the view of legitimate profit, and as a safeguard against any unexpected or sudden increase in the mortality, and in the fluctuation of interest. If they act prudently for their own interest, as well as for the safety of the assured, they will take care to charge such a rate of premium as will, in the opinion of an experienced and qualified Actuary, meet every probable risk, and cover the expenses of management, and will, in addition to the interest to be obtained by ordinary investment, also yield them a fair equivalent for the money which they have risked for the protection of the assured.

The Author is not contending for high or excessive rates; all that is desired is, that the rates should be sufficient and fully adequate to meet the risks and expenses incurred. On this point Mr Griffith Davies makes the following excellent observations. "The evil of charging excessive premiums cannot, however, long remain in a country where capital is allowed to flow freely from one channel to another, as the natural effects of competition must necessarily reduce the profits on Life Assurance to the level of that derived from other species of investments; on the

contrary, the peculiar nature of the subject renders it extremely dangerous lest the rates for Life Assurance should be so far reduced as to diminish the security of those who may select this mode of ac-cumulating their savings for the benefit of their families; for if the premiums charged by societies established for these purposes should, by excessive competition, be rendered inadequate to the payments of the claims which, sooner or later, must come upon them, whatever honour, wealth, or probity, the present managers of them may possesswhatever capitals they may boast of-or however prosperous they may appear to go on, even for a considerable time, the result must ultimately terminate in litigation, disappointment and ruin, and instead of a national benefit, Life Assurance in such a case would inevitably become a national calamity."

The Equitable Life Office, whose great success is generally appealed to in justification of reduced premiums, it must be remembered not only enjoyed a monopoly, but, as has already been stated, the rate of premiums originally charged was enormously high, and, in addition to this, they were enabled to invest their funds in the purchase of government stock at very low prices, for, as observed by the late Mr. Morgan, "during the long series of years in which this society has existed, the nation, for a considerable part of the time, has been engaged in foreign wars. These, by depressing public credit, have afforded the opportunity of investing money in

the funds to great advantage, and have thus contributed in no inconsiderable degree to create the surplus of the society. From the year 1777 to 1786, the average price of stock in the 3 per cents. was about 60 per cent., and from the year 1796 to 1816, the average price of the same stock was below 60 per cent., or 24 per cent. lower than its present price. But no reliance ought to be placed on advantages of this kind. Another war may reduce the value of stock in the funds to half its present value, or still lower, if some of our modern statesmen should succeed in breaking the public faith by destroying the sinking fund. It would be madness, therefore, to found any measure on a property so fluctuating. The addition to the surplus arising from the improved state of public credit is an accidental circumstance, affording no proof of the excellence, any more than a deficiency in the capital arising from its depreciated state would have afforded proof of any defects in the construction of the society, and is mentioned merely as one of the causes which have produced its present opulence."

And in 1828, when the pamphlet from which the above observations have been quoted was written, and when the price of consols varied from  $82\frac{1}{8}$  to  $88\frac{3}{8}$ , he proceeds to observe —"That all the causes hitherto noticed as having conduced to promote the welfare of the society, no longer exist to enrich it. The premiums have been reduced in some instances nearly one-half. The

policies are seldom or ever forfeited; and the purchases made in the public funds at their present price are more likely to be disadvantageous than beneficial to the society."

From 1829 to the present year the average price of consols has been about 90, and the price at present is 96\*, so that it will appear that at the present time circumstances are peculiarly unfavourable, so far as the interest of money is concerned, for the success of any new undertaking which does not take the precaution of adding a considerable per centage to the net premiums to cover any extraordinary mortality, the expenses of management, and the fluctuation in interest.

By reference to Table 8, it will appear that the expectation of an Irish life at 20, is 34.95; at 30, 29.71; at 40, 23.36; at 50, 17.76; so that, as compared with the combined English experience, an office may calculate upon receiving upon an Irish life of 20, only thirty-five premiums, instead of forty-one; at 30, only thirty instead of thirty-five; at 40 only twenty-four premiums instead of twenty-eight; and at 50 only eighteen premiums instead of twenty-one. Notwithstanding this fact, in addition to the risk already incurred of charging too low a rate of premium even for the English lives; if report speaks true, some of the cheap offices do a very extensive Irish business, so that an extensive business, and the announcements which

<sup>\*</sup> December 21, 1843.

are frequently seen among the advertisements of the day, to the effect that in addition to a large subscribed capital, the policy holders have the additional security of  $\mathcal{L}$  per annum for premiums, are not always to be taken as indicative of extensive security; for where much Irish business is transacted the advertisement, strictly speaking, should run—"in addition to a large subscribed capital the policy holders have the additional security of  $\mathcal{L}$  per annum annual income for premiums,  $\mathcal{L}$  of which are from Irish Assurances, from which the society has reason to expect they will receive several premiums less than they ought, and than which they expect to receive on an English Assurance"

The offices generally are getting very cautious of Irish lives, and the circumstance is only mentioned here to point out an *additional* risk that the cheap offices incur.

These remarks have been extended to a much greater length than was intended, and the Author would, in conclusion, merely express a hope that the example of liberality set by the various private companies in contributing their experience, and of disinterested zeal displayed by the Actuaries who superintended the compilation of the materials, and deduced therefrom a rate of mortality amongst assured lives, will be followed by the government, and by their Actuary Mr. Finlaison, in supplying the materials which, it is presumed, they possess in abundance in several of the government depart-

ments relative to sickness and mortality, which might be worked out by Mr. Finlaison, or under his superintendence. In the mean time, it would not, perhaps, be considered too liberal on the part of the government, if they were to print, for the benefit of the public, the various tables on Life Contingencies, which their actuary has made from government records, and at the national expence, and, in reference to which, the following petition was printed, and signed by upwards of 40 gentlemen connected with Life Assurance Offices in the year 1837, but which was never presented, probably in the expectation that the agitation of the matter would be sufficient to induce their publication.

TO THE HONOURABLE THE COMMONS OF THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND, IN PARLIAMENT ASSEMBLED.

The humble Petition of the undersigned Actuaries of Life Assurance Offices, in London, and of others connected therewith.

#### SHEWETH,

That a very large portion of the property of this country is held upon tenures depending upon the duration of human life, and that the business of Life Assurance has of late extended so as to affect the interests and future happiness of large numbers of all classes in the community.

That one of the principal elements in all calculations of the value of property depending on human life, and of the value of the risks of Life Assurances, is the average duration of human existence, as determined by observations: and the means by which such calculations are made or facilitated, are tables of the value of Life Annuities, deduced therefrom.

That as the accuracy of Annuity, and other tables, founded on the rate of mortality, depends upon the extent of the observations from which they are derived, every addition to them is of national importance.

That to adjust equitably the value of church property, and other life interests,—to measure truly Life Assurance risks, and to afford the means of satisfying the public of the just application of correct principles in such valuations, it is highly necessary that every authentic information bearing upon the subject, should be made generally accessible.

That very extensive tables, have been calculated at the national expense, from data, furnished by Government Records, which were printed by order of your Honourable House, in 1829: and that on these tables the Government now grant Annuities on lives, and it has recently been proposed in your Honourable House, that the value of church property, should be estimated by the same standard.

That of these tables a very limited portion only has hitherto been made available to the public.

Your Petitioners, therefore, humbly pray that your Honourable House will be pleased to order the publication of all tables founded upon the same data as those upon which the Government now grant Annuities on Lives. These tables will comprehend Annuities on Single Lives for males and females

separately, and on every combination of two or more joint lives, at every rate of interest at wh ich they have been respectively computed.

London, June, 1837.

As the above petition has never been presented, it has been thought desirable to print it in this Introduction, as it is important that the public should know that there are some valuable and very extensive tables in the hands of the government calculator, which "have been computed at the national expence," and which it is submitted ought to be printed for the public information.

# PRACTICAL EXAMPLES

ILLUSTRATIVE OF

## THE CONSTRUCTION AND APPLICATION

οP

# THE TABLES.

# COMPOUND INTEREST.

## TABLE I.

Interest is a remuneration allowed by a party borrowing money to the party lending it, and is payable at periods agreed upon at a certain annual rate for every £100. Where it is so paid, the Interest is called "Simple Interest," but where it is not so paid and is added to the sum lent whereby the sum due from the borrower is increased by that amount upon which (instead of upon the original sum) he will have to pay interest—such interest is called "Compound Interest."

# EXAMPLE 1.

What will £450 amount to in 12 years at 4 per cent. Compound Interest?

If £100 were lent for one year at 4 per cent. its

amount at the end of the year would be £100 + 4 = £104, and this divided by 100 would give the amount of £1 at the same rate at the end of the year, or £1.04 from which we may easily determine the amount of any other sum in one or more years; for if  $1:1.04::1.04:(1.04 \times 1.04) = 1.04^2 = 1.0816$  the amount of £1 at 4 per cent. at the end of two years, and in like manner; if  $1:1.04::1.04^2:(1.04\times1.04^2)$ =  $1.04^{\circ}$  = 1.124864—the amount of £1 at 4 per cent. in three years; and so on for any number of years; the amount of £1 obtained for any given number of years at the given rate of interest multiplied by the amount of £1 at the same rate for one year will give the amount for the succeeding year, and in this manner Table I. has been constructed, on reference to which, under the head of 4 per cent., against 12 years, we find £1,601032 which multiplied by 450 will give £720.4644\* = £720 9s.  $3\frac{1}{2}$ d., the amount of £450 in 12 years, at 4 per cent. as required; and so with any other amount at the same or any other rate per cent. The Rule being—Find the amount of £1 in the Table under the given rate per cent. against the given number of years, and multiply it by the sum of which the amount at the same rate and for the same period is required.

If the interest is payable half yearly the rule is—

<sup>\*</sup> To persons unacquainted with Decimals, it would be useless to give a rule for the conversion of shillings, pence, and farthings into decimals, and vice versa, such persons, therefore, are referred to works on Arithmetic. To those who are acquainted with Decimals it is unnecessary to do so.

Take one half of the annual interest and double the number of years, and proceed as in the case where interest is paid annually. For example, if in the above case the interest were payable half yearly, the amount would be obtained thus-Under column 2 per cent., in Table 1, and against 24 years, we find £1.608437—the amount of £1 at 2 per cent. per annum in 24 years, or, which is the same thing, the amount of £1 at 2 per cent. per half year in 24 half years, which, multiplied by 450, gives £723.79665 = £723 15s. 11d.—Answer. And if interest were payable quarterly the rule would be— Take one fourth of the annual interest and multiply the number of years by 4, and proceed as in the case where interest is paid annually. If, in the above example, the interest were paid quarterly, we should refer to column headed 1 per cent., in Table 1, and against 48 years, we should find £1.612227 the amount of £1 at 1 per cent. per annum in 48 years; or, which is the same thing, the amount of £1 at 1 per cent. per quarter, for 48 quarters of a year, which, multiplied by 450, would give £725.50215 = £725 10s.  $0\frac{1}{2}$ d.—Answer.

It evidently matters not whether the "rate" be called the rate per annum, or per half year, or per quarter, as the amount of any sum at a given rate of interest manifestly depends upon the number of conversions of interest into principal.

# EXAMPLE 2.

The amount of £450 in 12 years at 4 per cent.,

Compound Interest, payable annually, - - being £720 9s.  $3\frac{1}{2}$ d.

# payable half yearly # £723 15s. 11d.

# quarterly # £725 10s  $0\frac{1}{2}$ d.

it is required to find the total amount of interest realized. This will evidently be the difference between the sum lent and its amount at the end of the time, and will be respectively,

£720 9s.  $3\frac{1}{2}d.-£450 = £270$  9s.  $3\frac{1}{2}d.$ , Amount of interest realised upon £450 in 12 years, at 4 per cent. interest, payable yearly. £723 15s. 11 d.—£450 = £273 15s. 11d., do. do. payable half-yearly.

£725 10s.  $0\frac{1}{2}$ d.—£450 = £275 10s.  $0\frac{1}{2}$ d, do. do. payable quarterly.

# DEFERRED SUMS CERTAIN.

## TABLE II.

The present value of a sum of money to be received at the end of any number of years, is that which, laid out at a given rate per cent. will amount at that rate, to the sum to be received at the expiration of the given period.

#### EXAMPLE.

In exmaple 1, of Compound Interest £720 9s.  $3\frac{1}{2}$ d. = £720.4644 is stated to be the amount of £450 at 4 per cent. in 12 years. £450, therefore, ought to be shewn by Table 2, to be the present value of £720 9s.  $3\frac{1}{2}$ d. to be received at the expiration of 12 years, supposing interest to be 4 per cent.

On referring to Table 2, under the head 4 per

cent., and against 12 years, will be found £.624597, the present value of £1 to be received at the expiration of 12 years, which multiplied by 720.4644 will give £450, the present value required. sum might have been obtained by dividing £720.4644 by 1.601032 the amount of £1 in 12 years. For if  $1.04:1::1:\frac{1}{1.04}$  the present value of £1 at 4 per cent. Compound Interest to be received at the expiration of one year; and similarly,—if 1.04:1::  $\frac{1}{1.04}$ :  $\frac{1}{1.04)_2}$ —present value of £1 at the same rate to be received at the expiration of two years; and so on for any number of years. In this manner Table 2 has been formed—unity being divided by the amount against each age at the several rates per cent. in Table 1; and it is manifest that when the present value of £1 for any number of years at a given rate is found, that the Rule for finding the present value of any other sum at any rate per cent. will be Multiply the present value of £1 at the given rate and the given number of years by any other amount of which at that rate and for that term the present value is required.

# ANNUITIES CERTAIN—AMOUNTS. TABLE III.

An Annnity Certain, is a sum of money payable at fixed periods without being subject to any contingency.

#### EXAMPLE.

What will an Annuity of £20 per annum amount to in five years, at 6 per cent. Compound Interest?

On reference to Table 3, under 6 per cent. against 5 years will be found 5.637093, the amount of an Annuity of £1 at that rate and for that term, (or, as it is usually called, the number of years purchase,) which multiplied by 20 gives £112,74186=£112 14s. 10d.—Answer.

The results contained in the Table were obtained thus:--The last payment of an Annuity of £1, at 6 per cent. and upon which no Interest is received is.....£1.000000 The last payment but one, and upon which one year's Interest accrued ...... 1.060000 Their Sum—Amount of Annuity in 2 years 2.060000 The last payment but two, with 2 years' Their Sum—Amount of Annuity in 3 years 3,183600 The last payment but three, with 3 years' Interest . . . . . . . . . . . . . . . . . 1.191016 Their Sum—Amount of Annuity in 4 years 4.374616 The last payment but four, with 4 years' Interest ...... 1.262477

Their Sum .....£5.637093 amount of Annuity of £1 forborne 5 years (or the number of years purchase) and agrees with the

amount given above as taken from the Table; and by proceeding in this manner the Amount of an Annuity for any rate and for any period may be obtained. The Rule for the construction of the Table being To £1.00000, add the amount of £1 at the expiration of one year, at the given rate of interest obtained from Table 1, which will give the amount of an annuity at that rate forborne two years, to this sum add the amount of £1 in two years, which will give the amount of the annuity for three years, and so on (as in the above example) to the end of the period required. The Table being formed, the rule for finding the amount of any other sum annually will be, Obtain from Table 3 the Amount of an Annuity of £1 at the given rate per cent. and for the given term, and multiply it by the annuity, whose amount, at the same rate and for the same period is required.

If the annuity is payable half yearly, Take the quantity from the Table under half of the rate per cent. opposite twice the number of years, and multiply it by one-half of the annuity.

If payable quarterly, Take the quantity opposite one-fourth the rate per cent. and opposite four times the number of years, and multiply it by one-fourth of the annuity.

Or the amount of an Annuity might be found by the following Rule:—

Obtain from Table 1 the amount of £1 at the given rate of Interest and against the given number of years; subtract unity from it and divide the remainder by the Interest of £1 for one year at the same rate, which will give the amount of an Annuity of £1 at that rate and for that term, and multiply the quotient by the Annuity whose amount is required Table 3 might also have been formed in this manner though not so readily.

The reason of this rule is manifest, for when unity is deducted from the amount of £1 at the given rate and for the given term obtained from Table 1, the remainder must be the total amount of interest realised, and this amount accrued by putting by the interest due each year, upon which also interest was obtained, therefore the difference between the amount of £1, at any rate and for any term, and £1, the sum originally laid out, is equal to the amount of an annuity of the interest of £1 at the same rate and for the same term.

The above example might therefore have been obtained thus. From the amount of £1 at 6 per cent. in five years, which, by Table 1, is £1.338226, take £1, the original sum laid out, and the difference £0.338226 is the total interest realised, or the amount of an annuity of £.06 at 6 per cent. in five years; then, by the common rule of proportion:—If £.06: £0 338226:: £1:.56371--the quantity, given above as obtained from Table 3, to the nearest 4th place of decimals, which, multiplied by 20, gives £112.742=£112 14s.10d. as before.

Table 3, has been constructed upon the supposition that the annuity is payable at the end of the year; if it were payable at the beginning of the year each of the amounts in that Table ought to be in-

creased by one year's interest; the amount of the last payment, therefore, reckoning interest at 6 per cent. upon which one year's interest accrued would be.....£1.060000

The last but one upon which two years interest had been received..... 1.123600

# ANNUITIES CERTAIN—PRESENT VALUES.

## TABLE IV.

1st. Immediate Annuities.—The present value of an Annuity to be entered upon immediately and to continue for a term of years, is that sum which paid down now and invested at a given rate of Interest will, at the expiration of the term,

amount to the same sum as will the Annuity itself invested in like manner.

#### EXAMPLE 1.

What is the present value of an Annuity of £30 per annum to continue 4 years, reckoning Interest at 4 per cent.?

On referring to Table 4, under the head of 4 per cent. and opposite to 4 years will be found £3.629895 the present value of an Annuity of £1 at that rate and for that term, which multiplied by 30, gives £108.89685 = £108 18s.—Answer.

PROOF.—By Table 1, under the head of 4 per cent. and against 4 years we find £1.169859, the amount of £1 in 4 years at 4 per cent., which multiplied by 108.89685 = £127.3938 = £127 7s. 10d., the sum to which £108.89685 the present value of an Annuity of £30 at 4 per cent. will amount to in 4 years, and

By Table 3, under 4 per cent. and against 4 years will be found £4.246464, the amount of an Annuity of £1 in 4 years at 4 per cent., which multiplied by 30 = £127.3939 = £127 7s. 10d. the amount of an Annuity of £30 at the same rate and for the same term, thus proving the accuracy of the present value as determined from Table 4.

The total present value of an Annuity for a term of years is manifestly equal to the sum of the present values of each year's payment, and by the continued addition of these at the several rates of Interest Table 4 has been formed. For example—by Table 2.

£0.961538 is given as the present value of £1 to be received at the expiration of 1 year at 4 per cent. Interest.

 $\pounds$ 0.924556 ditto ditto at the expiration of 2 years.

£1.886094 Sum of the above, or present value of an Annuity of £1 for 2 years.

 $\pounds$ 0.888996 present value of  $\pounds$ 1 to be received at the expiration of 3 years.

£2.775090 Sum of the above, or present value of an Annuity of £1 for 3 years.

 $\pounds 0.854804$  present value of  $\pounds 1$  to be received at the expiration of 4 years

£3,629894 Sum of the above, or present value of an Annuity of £1 for 4 years, &c. &c.

2nd. Perpetual Annuity is that sum which paid now and invested at a given rate of Interest will perpetually produce the same amount as will the Annuity itself invested in like manner.

It is manifest that if £100 were sunk at 5 per cent. that it would be the present value of a Perpetual Annuity of £5, and consequently that £20 would be the present value of a Perpetual Annuity of £1, for— If £5 : 100 :: 1 : 20 or

If £.05 : £1 :: 1 :  $\frac{1}{.05} = 20$  — and in a similar manner the present value of a perpetuity at any other rate of Interest might be found, there-

fore The present value of a perpetuity of £1 may be found by dividing £1 by the Interest of £1 at the given rate for one year, and the quotient multiplied by any other perpetuity will give the present value of such perpetuity.

## EXAMPLE 2.

What is the present value of a Freehold Estate producing £150, per annum, reckoning Interest at 4 per cent.?

At the end of Table 4, under column headed 4 per cent, will be found  $25 = \frac{1}{.04}$  which multiplied by £150 = £3750.—Answer.

Now at 4 per cent. £3,750 sunk will yield £150 per annum, therefore £3,750 invested at 4 per cent. and never withdrawn, is equal to a Perpetual Annuity of £150 invested in like manner, it producing annually exactly that sum.

3rd. Deferred Annuities.—The present value of an Annuity not to be entered upon until the expiration of a given period, is that sum which paid down now and invested at a given rate of Interest will, at the end of the period during which the Annuity is deferred, amount to the sum which will *then*, at the same rate of Interest, purchase the Annuity in question to be entered upon *immediately*.

# EXAMPLE 3.

What is the present value of an Annuity of £30, to be entered upon at the expiration of 4 years and then to continue 10 years, reckoning Interest at 4 per cent.?

By the exemplification of the construction of Table 4, it has been shewn that the total value of an annuity for any given term is equal to the total of the present values of each year's payment throughout the term, consequently if the present value of the first, or any number of year's annuity, is deducted from the present value of the annuity for the whole term, the difference will be the present value of the annuity for the remainder of the term.

In the present case 4 + 10 = 14—the period during which the annuity is deferred, added to the period it is to be continued when entered upon, and on reference to Table 4, under 4 per cent., and against 14 years, will be found 10.563123, the present value of an annuity of  $\mathcal{L}1$ , to be entered upon immediately, and to continue 14 years, and in the same column opposite 4 years will be found £3.629895, the present value of an annuity of £1, to be entered upon immediately, and to continue four years, therefore £10.563123—£3.629895 = £6.933228, present value of an annuity of £1, to be entered upon at the expiration of four years, and then to continue ten years, which, multiplied by 30 = £207,99684 = £207,198.11d. the present value of an annuity of £30 deferred for the like period and to be continued for the same term.

PROOF.—On reference to Table 1, under the head of 4 per cent., and against four years, will be found £1.169859, the amount of £1 in four years, at 4 per cent. which, multiplied by 207.99684 gives £243.3268, which will be found to be the present value of an annuity of £30, to be entered upon immediately, and

to continue ten years; for, by Table 4, under 4 per cent. and against ten years, we find £8.110896, the present value of an annuity of £1, to be entered upon immediately, and to continue ten years, which, multiplied by 30, will give £243.3268, as before.

If the annuity were a Deferred Perpetuity, the present value would be found in a similar manner; the general rule being, From the present value of the annuity for the whole of the term, at the given rate of interest, subtract the present value of the annuity at the same rate for the term during which it is to be deferred. And, consequently, the value of a deferred annuity subtracted from the value of the whole term annuity, will leave the value of the temporary annuity, i. e. of the annuity for the term deferred.

# NEW RATE OF MORTALITY.

#### TABLE V.

The numbers in column 2, of Table 5, against each age in column 1 are the numbers which have completed or survived those ages out of the 100,000 who completed their 10th year of age, and from which, by the simple rule of Proportion, the number who might be expected to survive any given age or die within the term, out of any other number, at any age, &c. may be ascertained.

#### EXAMPLE 1.

Out of 3,500 persons living at the age of 20, how many may be expected to survive the age of 40?

On reference to Table 5, it will be found that there are at 20 years of age 93,268 persons living, of whom 78.653 survive the age of 40; then

As 93.268: 78.653::3500: 2952 nearly, the number out of 3500 at the age of 20 who may be expected to survive the age of 40.

## EXAMPLE 2.

It is required to determine the number of deaths that may be expected out of 3500 persons alive at the age of 20 during the next 20 years?

By Table 5, it appears that the number living at the age of 20 is 93,268 and the number living at the age of 40 is 78,653, therefore 93.268—78.653 = 14.615 the number who died during the interval, hence 93,268: 14.615::3500: 549 the number who may be expected to die in 20 years or before attaining 40 years of age, out of 3500 alive at 20 years of age.

# PROBABILITIES OF LIFE.

TABLE VI.

EXAMPLE 1.

Required, the probability of a person aged 30, dying within and surviving one year?

On reference to column 2, in Table 6, and against 30 years of age, will be found .0084248, the probability of a person aged 30 dying in one year; and on reference to column 3, in the same Table and against the same age, will be found .9915752, the probability of a person aged 30 surviving one year; and the two added together will give unity or certainty, for it is manifestly certain that a person at any age will either survive a given period or die within it, from which it follows that if we know the probability of a person at any age dying within any given period, and subtract it from unity, the difference or remainder will be the contrary probability, or the probability of surviving the given period; and, on the other hand, if we subtract the probability of surviving from unity, the remainder will give the probability of not surviving, or of dying within the given period.

The probabilities of dying within one year are obtained by dividing the number of deaths against each age by the number living at the same age, and the quotient subtracted from unity gives the probability of surviving one year. Or, the probability of surviving one year may be obtained by dividing the number living one year older than the given age by the number living at the given age, and the quotient subtracted from unity gives the probability of dying within one year. And in this manner Table 6 was constructed.

#### EXAMPLE 2.

Required the probability of a person aged 16, surviving the age of 20?

This will evidently be the number living at the age of 20, divided by the number living at the age of 16, or by Table 5,  $\frac{93268}{95965} = .97190$ 

#### EXAMPLE 3.

Required the probability of a person aged 16, dying in the 21st year of his age.

The number who die in the 21st year of age, being the decrement set against age 20, according to Table 6, is 680, and this divided by 95965, the number living at 16, will evidently give the probability of one of that number dying in the 21st year of age, or  $\frac{680}{05965}$ ; this probability might have been obtained by subtracting the probability of the life surviving the 21st year of age, from the probability of its entering upon that age, or the probability of its surviving the 20th year of age, thus:—

$$\frac{93268}{95965}$$
 -  $\frac{92588}{95965}$  =  $\frac{680}{95965}$  as before, and

this will be manifest upon inspection, as the first numerator is the number living at 20, and the second, the number living at 21, and the difference is the number of deaths which occur within the 21st year, and the denominator the number living at 16, is common to each of the three fractions.

From the above it will appear that, the rule for

determining the probability of a life surviving any age is,

Divide the number living at the advanced age by the number living at the present age.

And of its failing in any year of age,

Divide the number of deaths which occur in that year\* by the number living at the present age; or subtract the probability of the life surviving the given year from the probability of its entering upon that year.

#### EXAMPLE 4.

Suppose a Life Assurance Office to have 2000 policies in force, averaging £1000 each policy, viz., 200 at 25 years of age; 300 at 30; 400 at 35; 500 at 40; 300 at 45; 200 at 50; 50 at 55; and 50 at 60; it is required to determine the number and the amount of claims by deaths that may be expected to be made within one year.

The probabilities of surviving and of dying in Table 6, being the probabilities of *one* person at the given ages dying within, or surviving one year, it is manifest that the probabilities of any other number dying within, or surviving that period, will be obtained by multiplying such probabilities by the number in question. Hence,

| Age.      | Probability of one<br>Person dying in<br>one year. |   | Number<br>of<br>Persons. |    | Probable number of Deaths. |
|-----------|--|---|--------------------------|----|----------------------------|
| <b>25</b> | .0077700   | × | 200                      | == | 1.55400                    |
| 30        | .0084248   | × | 300                      | =  | 2.52744                    |

<sup>\*</sup> The number of deaths which occur in any year is represented by the decrement set opposite the next younger age.

| Age.      | Probability of one<br>Person dying in<br>one year. |   | Number<br>of<br>Persons. | , | Probable<br>number of<br>Deaths. |
|-----------|--|---|--------------------------|---|----------------------------------|
| 35        | .0092877   | × | 400                      | = | 3.71508                          |
| 40        | .0103619   | × | 500                      | = | 5.18095                          |
| 45        | .0122120   | × | 300                      | = | 3.66360                          |
| 50        | .0159386   | × | 200                      | = | 3.18772                          |
| <b>55</b> | .0216643   | × | 50                       | = | 1.08321                          |
| 60        | .0303362   | × | 50                       | = | 1.51681                          |
|           |  |   |                          |   |                                  |

# Total number of Deaths that may

 $22.42881 = 22\frac{1}{9}$ be expected, nearly, which multiplied by £1000, the amount of each policy, gives £22,429, the whole amount of claims that may be expected. This number, and the amount being determined from the policies in force at the beginning of the year, only indicates the probable number and amount of claims that may be expected to arise out of that number only, and upon the supposition that all the policies continue in force, except those which become claims. But as an addition will be made during the year, by the introduction of new business, and as some policies may lapse, or be surrendered, they must be taken into account before a comparison can be made of the number of deaths that might be expected, with the number that actually occurred. Of the new policies, and those surrendered, it may be assumed that taking one with another, they were each in force one halfyear, or, which is the same thing, that one-half of them were in force the whole of the year. In making the comparison at the end of the year, therefore, one-half of the number of new policies at each age, should be added to the number in force at each age at the beginning of the year, and one-half of those lapsed or surrendered at each age should be deducted from the number in force at each age, the numbers being thus corrected, the number of deaths expected according to the Table may be obtained as above. An office may, therefore, with very little difficulty, ascertain whether the amount of claims during the year is more or less than they had reason to expect.

## EXAMPLE 5.

Required the probability of two lives aged 16 and 21, both surviving 5 years?

The probability of a life aged 16, surviving 5 years, by Table 5 is  $\frac{92588}{95965}$ ; and of a life aged 21, surviving 5 years, is  $\frac{89137}{92588}$ ; and these two quantities multiplied together will give the probability in question. For *unity* or certainty bears the same ratio to either of the probabilities as the remaining probability does to that required, viz.,

As 1: 
$$\frac{92588}{95965}$$
 ::  $\frac{89137}{92588}$  :  $\frac{92588}{95965}$  ×  $\frac{89137}{92588}$   
=  $\frac{89137}{95965}$  = .92885 Answer.

Then to find the probability of any two given lives, both surviving a given period, the rule is simply,

Multiply the separate probabilities together, and the product will be the probability required; and the same rule applies to the probability of any two lives, both failing in, or within any given period, and in a similar manner the probabilities of three or more lives surviving, or failing within a given period, may be obtained.

# EXPECTATION OF LIFE.

## TABLE VII.

By Expectation of Life is meant the average number of years that a person, at any age, may yet expect to live, taking one life with another. For example, a person aged 30, (see Table 7, 30 years of age,) according to the experience amongst assured lives many expect to live  $34\frac{1}{2}$  years nearly, or, in other words, he may expect to attain the age of  $64\frac{1}{2}$  years nearly.

The total existence enjoyed in any one year by the number of persons alive at any age at the expiration of one year, will manifestly be as many years as there are persons who survive the year, added to the existence enjoyed by those who die within the year. And of those who die within the year, it is probable that as many die at equal intervals during the first half year, as die at the same intervals during the last half of the year, or, in other words, that of

those who die in any one year, taking one life with another, it may fairly be assumed that, upon an average, they each enjoy one-half year's existence—therefore, the total existence enjoyed at the expiration of a year, by those alive at any given age at the beginning of the year, is equal in years to the number who survive the year, plus one-half of those who died within the year.

EXAMPLE.

Required the number of years that a person aged 90, may expect to live.

| On rethat, of of 90. | eference to Table<br>f 1319 persons al | 5, i                 | t appears<br>t the age | them<br>many<br>perso | o enjoyed between in each year years as there a ens, or the under ioned number of the control of | as<br>are | To which we<br>must add one-<br>half of the num-<br>ber who died in<br>each year or | wnien                                       |
|----------------------|--|----------------------|------------------------|-----------------------|--|-----------|---|---|
| $\overline{892}$     | survived                               | 1                    | year.                  |                       | 892  |           | $213\frac{1}{2}$  | $1105\frac{1}{2}$                           |
| <b>570</b>           | ,,                                     | 2                    | ,,                     |                       | <b>57</b> 0  |           | 161   | 731   |
| 339                  | ,,                                     | 3                    | ,,                     |                       | <b>3</b> 39  |           | $115\frac{1}{2}$  | $454\frac{1}{2}$                            |
| 184                  | ,,                                     | <b>4</b><br><b>5</b> | "                      |                       | 184  |           | $77\frac{1}{2}$   | $261\frac{1}{2}$                            |
| 89                   | ,,                                     | 5                    | ,,                     |                       | 89   |           | $47\frac{1}{2}$   | $136\frac{1}{2}$                            |
| 37                   | "                                      | 6                    | "                      |                       | <b>37</b>  |           | 26  | 63  |
| 13                   | "                                      | 7                    | "                      |                       | 13   |           | 12  | 25  |
| 4                    | "                                      | 8                    | "                      |                       | 4  |           | $4\frac{1}{2}$  | $8\frac{1}{2}$                              |
| 1                    | "                                      | 9                    | ,,                     |                       | 1  |           | $1\frac{1}{2}$  | $2\frac{1}{2}$                              |
| 0                    | "                                      | 10                   | ,,                     |                       | 0  |           | $4\frac{1}{2}$ $1\frac{1}{2}$   | $8\frac{1}{2}$ $2\frac{1}{2}$ $\frac{1}{2}$ |
|                      |  | S                    | um                     | =                     | 2129   | +         | $659\frac{1}{2} =$  |   |

And this divided by 1319, gives 2.11, or  $2_9^1$  years expectation of life to a person aged 90, and agrees with the expectation as given in Table 7, opposite to 90 years of age.

The  $659\frac{1}{2}$ , the sum of all the halves of the number

of deaths in each year, is manifestly one-half of the number who were alive at the age of 90; the expectation might, therefore, have been obtained by dividing the sum of all who survived that age 2129, by the number alive at that age 1139, and adding to the quotient  $\frac{1}{2}$  for

$$\frac{2788\frac{1}{2}}{1319} = \frac{2129 + 659\frac{1}{2}}{1319} = \frac{2129}{1319} + \frac{1}{2} = 2.11$$

so that a Table of the Expectations of Life may easily be formed, by first obtaining the successive sums of the numbers surviving each age, and then dividing them by the number living at each age, and adding  $\frac{1}{2}$  to the quotient, and in this manner Table 7 was constructed.

# COMPARATIVE EXPECTATIONS OF LIFE.

## TABLE VIII.

This Table speaks for itself, and sets forth the Expectations of Life as deduced from various rates of mortality, and also amongst the different descriptions of assured lives, and will be found not only very interesting, but very important, particularly as from the Irish experience, it appears that, of that class of assurances, at some of the younger ages, the Expectation of Life is as much as 6 years less than that obtained from the combined English town and

country experience.—(See observations on the Irish experience, in "Introduction.")

# LIFE ANNUITIES AND ASSURANCES.

## TABLES IX. X. AND XI.

#### ANNUITIES.

Required the Value of an Annuity of £1 per annum, on a life aged 97, reckoning interest at 3 per cent?

If this were an annuity certain, its value would be equal to the sum of the present values of £1, to be received at the expiration of 1 and 2 years, but as the payment of the annuity is contingent upon the existence of the life the value of each year's payment of the Life Annuity will be less than that of an annuity certain, in the ratio of unity or certainty to the probability of the life surviving each year.

By Table 2, under the head of 3 per cent., we find.

.970874 = present value of £1, to be received at the expiration of one year.

.942596 = ditto ditto, two years. and, by Table 5 we find the number living at the ages 98 and 99 to be respectively 4 and 1, and these, divided by 13, the number living at 97 will give  $\frac{4}{13}$  and  $\frac{1}{13}$ , the probability of a life aged 97 surviving 98

and 99 years of age; the latter—the oldest age which can be survived according to the Table. The present value of the first year's payment, therefore, on a life aged 97, will be

As 1 : 
$$\frac{4}{13}$$
 :: .970874 =  $\frac{4 \times 970874}{13}$ 

And of the second,

As 1 : 
$$\frac{1}{13}$$
 ::  $.942596 = \frac{1 \times .942596}{13}$ 

And the total value will be

$$\frac{(4 \times 970874) + 1 \times (.942596)}{13} = \frac{4.826092}{13} = 0.371$$

as given in Table 12, in column headed 3 per Cent., opposite to 97 years of age.

Now the value of a fraction is not altered in any degree by multiplying its numerator by any quantity provided we also multiply its denominator by the same quantity. For example, if we multiply the numerator and denominator of the fraction  $\frac{1}{2}$ , by 2 and by 30, we get  $\frac{2}{4}$ , and  $\frac{30}{60}$ , each of which is still equivalent to  $\frac{1}{2}$ , for if the fraction in question be of 60 shillings,  $\frac{1}{2}$  of it is 30s., and  $\frac{1}{4}$  of it being 15s.,  $\frac{2}{4}$ ths. is necessarily 30s., and, in like manner,  $\frac{1}{60}$ th. of 60s. being 1s., the  $\frac{30}{60}$ ths. must be 30s. and so with any other fraction. If, for example, we say, the probability of a person living 1 year is  $\frac{1}{2}$ , of another  $\frac{2}{4}$ , and of a third  $\frac{30}{60}$ ths, their probabilities are each equal to  $\frac{1}{2}$ , this being premised, what follows will appear clear.

The following are the quantities given above, from

which the value of an annuity, on a life aged 97, at 3 per cent. interest, was obtained.

$$\frac{(4\times.970874) + (1\times.942596)}{13} = 0.371$$

which, expressed in words, is the number living at 98 years of age, multiplied by the present value of £1, to be received at the expiration of 1 year, plus the number living at the age of 99, multiplied by the present value of £1, to be received at the expiration of 2 years, divided by the number living at the age of 97.

Now, if we multiply each of the quantities in the numerator and denominator by .056858 the present value of £1, to be received at the expiration of 97 years, (the same as the age of the life,) we shall get

$$\frac{\left(4\times.055202\right)+\left(1\times.053594\right)}{13\times.056858}$$

i. e. the number living at 98, multiplied by the present value of £1, to be received at the expiration of 98 years, plus the number living at 99, multiplied by the present value of £1 to be received at the expiration of 99 years, divided by the number living at 97, multiplied by the present value of £1, to be received at the expiration of 97 years, which is equal to

$$\frac{.274402}{.739154}$$
 = .371 as before,

and in a similar manner, the value of an annuity at any other age may be obtained.

But the D and N columns for the rates  $2\frac{1}{2}$ , 3, and

 $3\frac{1}{2}$  per cent. in Tables 9, 10, and 11, contain the numerator and denominator that will obtain at each age; the quantities in column D being the number living at each age, multiplied by the present value of £1, to be received at the expiration of as many years as the age, and the quantities in column N, opposite to each age, are respectively the sum of all the quantities in column D., at all the ages older than the given age; therefore,

The quantity in column N, opposite to any age, divided by the quantity in column D, at the same age, will give the value of an annuity at that age.

And in this manner the values of the annuities at  $2\frac{1}{2}$ , 3, and  $3\frac{1}{2}$  per cent. in Table 12 were obtained.

For example, at  $2\frac{1}{2}$  per cent. (See Table 9.)

of an annuity of £1 per annum on a life aged 98, and agrees with the value given in Table 12.

of an annuity of £1 per annum, on a life aged 97, as also given in Table 12.

Column S in Tables 9, 10, and 11, is the sum of the quantity at each age, and at all the ages older than the given age in column N, and is useful in finding the values of increasing and decreasing annuities.

# ASSURANCES.

The difference between the value of an Annuity

and that of an Assurance is, that in the former, as has already been shewn, each year's payment depends upon the probability of the life *surviving* each year of age, whereas, in the latter, the value depends upon the probability of the life *failing* in each year, and in the calculation of the premiums, the sum assured is, in all cases, assumed to be payable at the expiration of the year in which the life fails.

The present Value, therefore, or "Single Premium" for an assurance on a life at any age, is equal to the sum of the present values of £1 certain, to be received at the expiration of 1, 2, 3, &c., &c. years to the end of life, multiplied respectively by the probability of the life failing in each year.

#### EXAMPLE.

Required, the single premium to secure £1 on a life aged 97, reckoning interest at 3 per cent.

By Table 2,—.970874 = Present value of £1 to be received at the expiration of 1 year.

,, 
$$.942596 = \text{ditto}$$
 ditto, 2 years ,,  $.915142 = \text{ditto}$  ditto, 3 ,,

And by Table 5,— $\frac{9}{13}$  = Probability of a life aged 97 failing in or before completing the 98th year of age.

$$\frac{3}{13}$$
 = ditto 99th year.  $\frac{1}{13}$  = ditto 100th ditto.

Then,

$$\frac{(9 \times .970874) + (3 \times .942596) + (1 \times .915142)}{13} = .96005$$

the Single Premium required; but if, as in the case of Annuities (see page 26) we multiply the numerator and denominator by .056858 the present value of £1 to be received at the expiration of 97 years, (the same number of years as the age,) the value will not be altered, and we shall have

$$\frac{(9 \times .055202) + (3 \times .053594) + (1 \times .052033)}{13 \times .056858} = .96005$$

as before, and in a similar manner the single premium for an assurance at any other age may be found.

But we have already got each of the denominators that would obtain at each age (the number living at each age multiplied by the present value of £1, to be received at the expiration of the same number of years as the age)—in column D, and the quantity in column M, opposite to any age, is equal to the sum of the decrements opposite to that age, and all the ages older than the given age in Table 5, multiplied respectively by the present value of £1. to be received at the expiration of one year more than the given age, as, for example:

Age. Decrement. Present value of £1 due at the end of one year more than the age.

99  $1 \times .052033 = .052033 = M$ , opposite to 99 years of age

98  $3 \times .053594 = .160782$ Sum = .212815 = M, ditto, 98

97  $9 \times .055202 = .496818$ Sum = .709633 = M, at 97

and the last quantity, .709633, is the sum of the products in the numerator above, and agrees with the

quantity in Table 10, in column M, opposite to 97 years of age, and the quantity in column D, opposite to 97 is .73915, and corresponds with the product of the quantities in the above denominator.

Then  $\frac{.70963}{.78915} = .96005$  as before, and agrees with the quantity in Table 15, in column headed, "Single Premium," opposite to 97 years of age, so that, where the columns D and M, are formed the rule to determine the single premium is, Divide the quantity in column M opposite to the age by the quantity in column D, opposite to the same age. and, in this manner, the single premiums at each age in Table 15 were obtained.

If the annual premium for an Assurance were £1 per annum, its equivalent present value, or "Single Premium," would manifestly be £1 paid down,\* added to the present value of an annuity of £1, to be paid during the life in question, or on a life aged 97

$$1 + \frac{.27439}{.73915} = N, \text{ opposite to } 97$$

$$\frac{1}{.73915} + \frac{.27439}{.73915} = D, \text{ do.}$$
which is equal to  $\frac{.73915 + .27439}{.73915} = \frac{1.01354}{.73915}$ 
then by the simple rule of proportion, If
$$\frac{1.01354}{.73915} : 1 :: \frac{.70962}{.73915} = M, \text{ at } 97 : \frac{.70962}{.73915} \times \frac{.73915}{1.01354}$$

$$= \frac{.70962 = M, \text{ at } 97}{1.01354 = N, \text{ at } 96} .70014$$

the annual premium for an assurance of £1 on a life aged 97, and corresponds with the quantity given in

<sup>\*</sup> The Annual Premium for an assurance is always paid at the beginning of the year.

Table 15, in column headed "Annual Premium," opposite to 97 years of age.

The rule, therefore, to determine the annual premium for an assurance of £1 is,

Divide the quantity in column M, opposite to the given age, by the quantity in column N, opposite to the age one year younger; and, in this manner, the annual premiums at each age, in Table 15, were obtained.

It is also manifest from the above that the annual premium might have been obtained by the following rule:

Divide the Single Premium by 1 plus the value of an annuity on the life at the given age.

Column R is the sum of the quantity at each age, and all the ages older than the given age in column M, and is useful in finding the values of increasing and decreasing assurances.

# LIFE ANNUITIES.—SINGLE LIVES.

## TABLE XII.

It has already been shewn, in page 27 that the rates  $2\frac{1}{2}$ , 3, and  $3\frac{1}{2}$  per cent. in this Table, have been constructed from the D and N columns in Tables 9, 10, and 11, but as D and N columns have not been constructed for any other rates of interest, it was found to occupy less time to calculate the remaining rates by the ordinary method.

As the payment of an annuity depends upon the

party being alive when it becomes due, and as an annuity is considered to be due at the end of each year, it is manifest that the value of an annuity on a life aged 99, the oldest age in the Table, is equal to 0; and on a life aged 98, the value, if the life were certain to survive the year, would at the end of the year be equal to £1, plus an annuity on a life aged 99, the *present value* of which reckoning interest at 3 per cent. is manifestly.

 $1+0 \times .970874 = .970874$ ; but as the life is not certain to survive the year, this value must be diminished in the ratio of certainty or unity to the probability of its surviving the year, and will be

As 
$$1:\frac{1}{4}::.970874:.\frac{.970874}{4}=.243$$

and corresponds with the value given in Table 12, under 3 per cent, and opposite to 98 years, and by proceeding in this manner from the oldest to the youngest age, the rates 2, 4,  $4\frac{1}{2}$ , 5, 6, 7, and 8, per cent. have been computed, and is the method adopted by Mr. Milne in his excellent treatise on annuities.

The rule being

Multiply unity added to the value of an annuity on a life one year older than the given life by the present value of £1, due at the end of 1 year, and by the probability of the given life surviving 1 year, and the product will be the value of an annuity on the given life.

The table being formed, the value of any other amount at any given age and rate of interest, may be readily obtained by the following rule: Multiply the annuity of £1 at the given age and rate per cent. by the annuity, whose amount is required, and the product will be the value of such annuity.

#### EXAMPLE 1.

Required the value of an Annuity of £150 per annum, on a life aged 54 reckoning interest at 3 per cent?

By Table 12, opposite to 54 years of age, will be found 12.385. the present value of £1 per annum on a life at that age, which, multiplied by 150 = £1857.75 = £1857.15 the value required.

If it were required to find what annuity should be granted in consideration of a sum to be paid down, the rule would manifestly be

Divide the sum to be paid down by the present value of an annuity of £1 on the given life at the given rate of interest, as for

## EXAMPLE 2.

What Annuity ought to be granted on a life aged 54 in consideration of £1857.15 paid down, reckoning interest at 3 per cent?

12.385 was shewn in the last example to be the value of an annuity at 3 per cent. on a life aged 54.

then  $\frac{1857.75}{12.385} = £150$  Answer,—and corresponds with the annuity in example 1, whose present value was shewn to be £1857.75 = £1857.15.

# LIFE ANNUITIES.—JOINT LIVES.

#### TABLE XIII.

The same reasoning employed with respect to Annuities on Single Lives, is applicable to Joint Lives, the rule to determine the value of an annuity on the latter being,

Multiply unity added to the value of an annuity on two Joint Lives, respectively, one year older than the two given lives, by the present value of £1, due at the end of one year, and by the probability of the two given lives jointly surviving one year.

#### EXAMPLE.

Required, the value of an Annuity on two Joint Lives aged 89 and 84, reckoning interest at 3 per cent?

The two lives one year older than these respectively, are aged 90 and 85, and, on reference to Table 13, in the column headed, "Older," will be found 90, and in the column on the right, headed, "Younger," will be found 85, opposite to which, in the column headed, 3 per cent, will be found,

0.946 the value of an annuity on two joint lives, aged 90 and 85,

And on reference to Table 6, it will be found that
.7076180 is the probability of a life aged 89,
surviving one year

.8103215 ditto 84 years, ditto

then  $.7076180 \times .8103215 = .57340$  the probability of the lives jointly surviving one year and by Table 2 .970874 = present value of £1 at 3 per cent. due at the end of one year.

then  $1.946 \times .970874 \times .57340 = 1.083$  the value of an annuity on the two lives aged 89 and 84 as required, and which corresponds with the value in Table 13, opposite to 89 and 84, in column headed 3 per cent., and in this manner by beginning at the ages

| 99               |          | 94  |                              |
|------------------|----------|-----|------------------------------|
|                  | . ,,     | i   |                              |
| then 98          | , "      | 93  |                              |
| // 97            | <i>"</i> | 92  | at the several rates of in-  |
| # 9 <del>6</del> | //       | 91  | terest, all the joint lives, |
| # 95             | //       | 90  | where the difference of age  |
| <b>y</b> 94      | L //     | 89  | is 5 were obtained, but it   |
| <b>#</b> 93      | //       | 88  | was not thought necessary    |
| # 92             | 2 //     | 87  | to print the values of any   |
| # 91             | //       | 86  | joint lives at an older age  |
| # 9C             | //       | 85  | than 90.                     |
| # 89             | //       | 84  | ·                            |
| &                | c.       | &c. |                              |

And in a similar manner all the other quantities at the several rates of interest and differences of age in Table 13 were obtained; the value of the oldest of the two given lives at the given difference of age being first obtained, and then the values of the next two respectively, one year younger, &c.

The Table being formed, the value of an Annuity for any amount at any of the given ages, and rates of interest, may be obtained in the following manner.

Multiply the value of the annuity of £1 at the given ages and rate of interest by the annuity, whose value is required, and the product will be the value of such annuity.

## EXAMPLE 1.

Required the value of an Annuity of £30 per annum on two joint lives aged 71 & 51, reckoning interest at  $3\frac{1}{2}$  per cent?

On reference to Table 13, in column " $3\frac{1}{2}$  per cent." opposite to 71 & 51, will be found 5.487, which, multiplied by 30, gives 164,610 = £164 12 2, the value required?

## EXAMPLE 2.

Required the value of an Annuity of £50 per annum on two joint lives aged 71 and 53, reckoning interest at  $3\frac{1}{2}$  per cent?

It will be found, on reference to Table 13, that both these ages are not contained in the Table, but against 71, the older age (in finding the values of annuities on joint lives, the older age is the index of the two ages), we find opposite to the column headed "Younger," that age 53 falls between 51 and 56, and the value at  $3\frac{1}{2}$  per cent. on

and 71 & 51 is 5.487Difference 0.247 and this being the difference for 5 years,  $\frac{1}{5}$ th or, 049 subtracted from 5.487 will give the

value on 71 & 52  $\frac{2}{5}$ ths # 098...... ditto ditto, on 71 & 53  $\frac{8}{5}$ ths # 147..... ditto ditto, # 71 # 54  $\frac{4}{5}$ ths # 196...... ditto ditto, # 71 # 55

then 5.487-098=5.389, which, multiplied by 50

=£269,450=£260 9, the value of an annuity of £50 per annum on two joint lives, aged 71 & 53, as required.

And in a similar manner the value of an annuity at any other ages not found in the Table may be obtained.

# TWO JOINT LIVES AND THE SURVIVOR.

An Annuity on the Last Survivor of two lives signifies an Annuity to be paid until the expiration of both lives.

It is manifest that an annuity during the joint continuance of two lives added to an annuity on the last survivor, are together equal to the sum of similar annuities on each of the lives, for in the case of the Joint Lives, the annuity would cease at the first death, and in the other on the death of the last survivor, consequently the value of the annuity on the last survivor may be obtained by subtracting the value of an annuity on the Joint Lives from the sum of the annuities on the two single lives.

#### EXAMPLE.

Required the value of an Annuity of £30 per

annum, on the last survivor of two lives aged 51 and 36, reckoning interest at  $3\frac{1}{2}$  per cent?

On reference to Table 12, in column headed  $3\frac{1}{2}$  per cent, will be found opposite to ages 51 and 36

12.795 = Value of annuity of £1 on a life aged 51, 17.037 = ditto ditto 36, 29.832 = Sum

And on reference to Table 13, in column headed  $3\frac{1}{2}$  per cent. will be found 11.260, the value of an annuity on the two joint lives; then 29.832—11.260 = 18.572, which multiplied by 30, gives 55,7160 = £55 14 4—Answer. And in a similar manner the value of an annuity of any other amount may be obtained, the rule being,

From the sum of the values of an annuity of £1 on the separate lives at the given rate, deduct the value of a similar annuity at the same rate on the Joint Lives and multiply the difference by the annuity whose value is required.

# ABSOLUTE REVERSIONS—PRESENT VALUES.

## TABLE XIV.

The mode of constructing this Table is explained in page 42.

### EXAMPLE.

What is the present value of the Reversion to £5000, or which is the same thing, the Single Premium for an assurance of £5000 to be received at

the end of the year, in which a life aged 60 may fail, reckoning interest at 4 per cent.?

By column 4 per cent. in Table 14, opposite to 60 years of age will be found .59943, the present value of the reversion of £1 on the failure of the life in question; then

 $.59943 \times 5000 = £2997.15 = £2997$  3 0 the value required.

# LIFE ASSURANCES—SINGLE LIVES.

TABLE XV.

## EXAMPLE 1.

What Single Premium should be charged for an assurance of £2500 on a life aged 55, reckoning interest at 3 per cent.?

By column headed "Single Premium," in Table 15, and opposite to 55 years of age will be found .62075 the Single Premium to assure £1 on the given life; then  $.62075 \times 2500 = £1551.875 = £1551 17 6$ , the Single Premium required.

# EXAMPLE 2.

What Annual Premium should be charged for an assurance of £4000 on a life aged 65, reckoning interest at 3 per cent.?

By column headed Annual Premium in Table 15, and opposite to 65 years of age, will be found.07745, the Annual premium for an assurance of £1 on the given life, then

 $.07745 \times 4000 = £309.8 = £309.16$ , the Annual Premium required.

The quantities in Table 15 were obtained by means of the D. N, and M, columns in Table 10, as explained in pages 28—31. The mode of obtaining the same results by the ordinary method will be illustrated in the following

## EXAMPLE. 3.

Required the Single Premium for an assurance of £1 on a life aged 97, reckoning interest at 3 per cent.

By Table 2 .970874 = Present value of £1, to be received at the expiration of 1 year.

 $_{\prime\prime}$  .942596 = ditto ditto, 2 years.

and by Table 5  $\frac{13-4}{13}$  = Probability of a life aged 97 failing in or before completing the 98th year of age.

 $\frac{4-1}{13} = \text{ ditto ditto, in 99th ditto}$ 

 $\frac{1}{13}$  = ditto ditto, in 100th ditto

Then (see page 28)

$$(\frac{13-4}{13} \times .970874) + (\frac{4-1}{13} \times .942596) +$$

 $(\frac{1}{13} \times .915142) = .96005$  Single Premium required as contained in Table 15, in column headed "Single Premium," opposite to 97 years of age.

Let us, however, separate the positive from the negative quantities, and we shall have  $(\frac{13}{13} \times .970874) + (\frac{4}{13} \times .942596) + (\frac{1}{13} \times .915142) = Positive quantities.$  If we divide each of these by .970874, the present value of £1, to be received at the expiration of one year, and multiply them *again* by that quantity, their value will still be the same, and we shall have

$$.970874 \left\{ \frac{13}{13} + \left(\frac{4}{13} \times 970874\right) + \left(\frac{1}{13} \times 942596\right) \right\}$$

But the sum of the two last quantities, as was shewn in page 26, is equal to £0.371—the value of an annuity on a life aged 97, if, therefore, we substitute this value we shall have

$$.970874 \left\{ \frac{13}{13} + 0.371 \right\} = 970874 + (.970874 \times 0.371)$$

Let us now bring down the negative quantities from the original expression which are,

$$(\frac{4}{13} \times 970874) + (\frac{1}{13} \times 942596)$$

But these have just been shewn to be equal to .0.371 the value of an annuity on a life aged 97, this quantity, therefore, must be subtracted from the above expression, which will give

$$.970874 + (.970874 \times .0.371) - 0.371$$
.

Now the middle quantity is the present value of £0.371 to be received at the expiration of one year, (for the present value of £1 due at the end of any number of years, multiplied by any other sum, gives the present value of that sum for the same period), and if we subtract it from the last quantity we shall have .01082 or the discount for one year of the value of

the annuity;\* then 970874—.01082=.96005, as before.

The rule, therefore, for finding the Single premium for an assurance by the ordinary method is

From the present value of £1 at the given rate of interest due at the end of one year subtract the discount for one year of the value of an annuity of £1 on the given life at the same rate of interest. And by this rule the quantities in Table 14 were obtained.

The Rule to determine the annual premium as shewn in page 31, is

Divide the single premium by 1 plus the value of an annuity on the life.

And in a similar manner it might be shewn, that the Rule to determine the Single Premium for an assurance on two Joint Lives is

From the present value of £1 at the given rate of interest due at the end of one year, subtract the discount for one year of the value of an annuity of £1 on the Joint Lives at the same rate of interest.

And for the Annual Premiums

Divide the single premium by 1 plus the value of an annuity on the Joint Lives.

And in this manner Table 16 was formed.

And similarly—

To find the Single Premium for an Assurance on the Last Survivor of Two Lives.

<sup>\*</sup> The discount of any sum is manifestly the difference between that sum and its present value, and may be obtained by multiplying the discount of £1 by any other sum, whose discount is required.

From the present value of £1 at the given rate of interest due at the end of one year, subtract the discount for one year of the value of an annuity of £1 on the last survivor, of the two lives at the same rate of interest.

And for the Annual Premium—

Divide the single premium by 1 plus the value of an annuity on the last survivor.

And in this manner Table 17 was formed.

# LIFE ASSURANCES.—JOINT LIVES.

## TABLE XVI.

The quantities in this Table were constructed by the following rules (see page 42.)

To find the Single Premium.

From the present value of £1 at the given rate of interest, due at the end of one year, subtract the discount for one year of the value of an annuity of £1 on the Joint Lives at the same rate of interest.

To find the Annual Premium:

Divide the Single Premium by £1 plus the value of an annuity on the Joint Lives.

## EXAMPLE 1.

Required the single and annual premium for an assurance of £1 on two lives aged 53 and 18, reckoning interest at 3 per cent.?

By column 3 per cent. in Table 2, and opposite to one year, will be found

.970874 the present value of £1 at 3 per centdue at the end of one year.

And 1 - .970874 = .029126 = discount of £1 at the same rate for one year.

By column 3 per cent in Table 13, opposite to 53 and 18, will be found,

11.776, the value of an annuity of £1 on the two Joint Lives.

And  $.029126 \times 11.776 = .34297$  = the discount of the annuity for one year.

Then .970874 - .34297 = .62790 the single premium required, and corresponds with the quantity in column "Single Premium," in Table 16, opposite to ages 53 and 18.

And  $\frac{.62790}{1+11.776} = \frac{.62790}{12.776} = .04915$  the Annual Premium required, and corresponds with the quantity in column "Annual Premium," in Table 16, opposite to ages 53 and 18.

And in a similar manner, the premiums at all the other ages in the Table were calculated, from which the Premiums, for assurances of any other amount may be readily obtained as shewn in the following examples.

## EXAMPLE 2.

Required the Single Premium that would be charged according to Table 16, to effect an assurance of £2000 on two lives, aged 54 and 29?

On reference to the Table in column, headed "Single Premium," and opposite to ages 54 and 29,

will be found .64306, the Single Premium for an assurance of £1 on the two lives, which, multiplied by 2000 gives £1286.12=£1286 2 5, the Single Premium required.

### EXAMPLE 3.

What Annual Premium should be charged for the above assurance?

On reference to Table 16 in column, Annual Premium per £1, and opposite to ages 54 and 29, will be found .05247 which multiplied by 2000 = 104.94 = £104 18 10, the Annual Premium required.

# LIFE ASSURANCES.—LAST SURVIVOR.

## TABLE XVII.

The quantities in this Table were constructed by the following rules, (see page 42.)

To find the Single Premium:

From the present value of £1 at the given rate of interest due at the end of one year, subtract the discount for one year, of the value of an Annuity of £1 on the last Survivor of the two lives at the same rate of interest.

To find the Annual Premium:

Divide the Single Premium by 1 plus the value of an annuity on the last survivor.

## EXAMPLE 1.

What Single and Annual Premium should be charged for an assurance of £1 on the last survivor

of two lives aged 46 and 41, reckoning interest at 3 per cent.?

By Table 13, in column 3 per cent.the value of an annuity of £1 on two joint lives aged 46 and 41 is. .12.488

Difference  $\cdot \cdot \overline{19.537} = \text{Value of}$ 

an annuity of £1 on the last survivor, (see page 37).

By Table 2, the present value of £1 at 3 per cent. due at the end of 1 year = .970874 and 1—.970874 = .029126 the discount of £1 at 3 per cent. for one year.

Then  $.029126 \times 19.537 = .56902$  the discount for one year of the annuity on the last survivor. And .97087 - .56902 = .40185 = the Single Premium required, and corresponds with the quantity in column "Single Premium" in Table 17, opposite to ages 46 and 41.

The Annual Premium, therefore, is equal to  $\frac{.40185}{1+19.537} = \frac{.40185}{20.537} = .01956$ , and corresponds with the quantity in column "Annual Premium per £1," in Table 17, opposite to the ages 46 and 41.

And in a similar manner the Premiums at the other ages in the Table were found, from which the value of an assurance of any other amount may readily be obtained as shewn in the following examples.

## EXAMPLE 2.

What Single Premium should be charged for an assurance of £5000 on the last survivor of two lives aged 60 and 50, reckoning interest at 3 per cent.?

By Table 17, opposite to ages 60 and 50, in column "Single Premium per £1," will be found .51671, the single premium for the assurance of £1, on the survivor of the two lives, which, multiplied by 5000, gives £2583.55 = £2583 11 0 the single premium required.

### EXAMPLE 3.

What Annual Premium should be charged for the above assurance?

By Table 17, opposite to ages 60 and 50, in column headed "Annual Premium per £1," will be found .03114, the annual premium for the assurance of £1, on the last survivor of the two lives, which, multiplied by 5000 gives £155.70 = £155 14, the annual premium required.

# VALUATION OF POLICIES—SINGLE LIVES.

## TABLES XVIII & XIX.

Let it be assumed that the Annual Premium upon an assurance is £1.

Then the value of all the future Premiums, where the Annual Premium has just been paid, is evidently equal to the value of an annuity of £1 on the given life.

And where the premium is just due, but not paid, the value is evidently greater by that amount, and is equal to £1 plus the value of an annuity of £1 on the given life.

The value of the future premiums, when estimated at any intermediate period between two successive payments, may, therefore, be obtained by deducting the value of £1 on the age of the assured, at the date of the last payment, from the value increased by unity of a similar annuity on the age at the next payment, and adding to the former a part of the difference, proportional to the time elapsed since the last payment became due; and the several values thus obtained are given for each year and month in Table 18.

And the value of the future payments of any other Annual Premium may be obtained by multiplying the quantities in the Table by such Annual Premium.

The quantities in Table 19, show the Single Premium required for an assurance of £1 on each age, from 10 to 70 with interpolated values for months in each year.

And the value for any other amount may be obtained by multiplying the quantities in the Table by such amount.

The Value of a policy at any time is manifestly the difference between the "Single Premium," for the sum assured on the age of the party, at the time the policy is proposed to be valued, and the then value of all the future premiums, expected to be received on such policy.

### EXAMPLE 1.

Required the value of a policy of £4000, effected at an annual premium of £100 13 4=£100.667 on a life aged 39, but now aged 57 years and four months?

By Table 19, in column, headed 4 months, and opposite to 57 years, will be found .64561, the single premium for an assurance of £1 on a life aged 57 years and 4 months.

Then  $.64561 \times 4000 = 2582.4 =$  Single Premium for an assurance of  $\pounds 4000$  on a life aged 57 years and 4 months.

And by Table 18, in column, headed 4 months, and opposite to 57 years, will be found 11.501, the value of the future premiums of £1 per annum, on a life aged 57 years and 4 months.

Then  $11.501 \times 100.667 = 1157.8 = \text{Value of future}$ Premiums.

And 2582.4-1157.8 = 1424.6 = £1424 12 the value of the policy as required.

## EXAMPLE 2.

Required the value of a policy of £3000, effected at an Annual Premium of £68 8 0, =68.4 on a life aged 36, but now aged 60, upon which the premium is just due, but not paid.

In this case the premium being just due, but not paid, the value of the future premiums will be 11.188,

the quantity in Table 18, opposite to 59 years and 12 months, (i.e. unity added to 10.188, the quantity opposite to 60 years of age,) multiplied by 68.4, which gives 765.25.

And by Table 19, the Single Premium for an assurance of £1, on a life aged 60, is .67414, which, multiplied by 3000, is equal to 2022.42.

Then, 2022.42 - 765.25 = £1257.17 = £1257 3 5 = the present value required.

If the premium in this case had been just paid, the value of the future premiums would be equal to 10.188, the quantity opposite to 60 years of age multiplied by 68.4=696.85.

And 2022.42 - 696.85 = 1325.57 = £1325 11 5 = the value required; which, it will be observed, is equal to the above value, plus £68 8s., so that the value of a policy, when the premium has just been paid, is equal to the value of the policy upon which the premium is due and not paid, plus the payment then made.

If one or more bonuses have been added to a policy, find the value at the present age of the sum assured by the policy, *plus* the amount of such bonuses, and proceed as before.

The value of a policy which had been effected by the payment of a single premium is manifestly equal to the single premium that would be required for an assurance of the same amount at the present age, and may be obtained from Table 19.

# TEMPORARY ANNUITIES AND ASSURANCES.

Comparative Advantages of the D, N, and M Method, and the Ordinary Method of Calculating the Values of Annuities and Assurances.

The D and N system was first employed by Mr. Griffith Davies, the Actuary of the Guardian Assurance Company, and the Formulæ used by him are somewhat analagous to those originally pointed out by the late Mr. Barrett.

The following examples will serve to show the superiority of the new method.

### EXAMPLE 1.

Required the value of an Annuity of £20 per annum on a life aged 36, to continue 10 years, reckoning interest at 3 per cent.

Rule by the D. and N. columns.

From the quantity in column N at the present age, subtract the quantity in the same column at the advanced age, and divide the difference by the quantity in column D at the present age.

In Table 10, 515312.329 = the quantity in column N, opposite to 36 the present age.

,,  $\frac{287000.704}{}$  ditto, opposite to 46, the advanced age.  $\frac{228311.625}{}$  = difference.

,, 28228.483 = the quantity in column D. opposite to 36 the present age.

then  $\frac{228311.625}{28228,483}$  = 8.088, the value required.

Rule, by the common method-

From the value of an annuity on the life at the present age, subtract the value of an annuity on the life at the advanced age, multiplied by the present value of £1 at the given rate of interest due at the end of the term for which the annuity is to continue, and by the probability of the life at the present age, surviving that term.

By column, headed 3 per

Do. do. 15.204=do. do. 46.

By Table 2, in column 3

per cent. opposite 10 years, .744094 = Present value of £1 at 3 per cent. due at the

end of 10 years.

By Table 5. . . . . . . . . . . . 73526 = Probability of a  $\overline{81814} \quad life \quad aged \quad 36,$  living 10 years.

Then  $15.204 \times .744094 \times \frac{73526}{81814} = 10.167$ 

And 18.255 - 10.167 = 8.088 as before.

The rule to find the value of a DEFERRED ANNUITY, by the D and N columns is,

Divide the quantity in column N, at the age the Annuity is to be entered upon by the quantity in column D at the present age.

## EXAMPLE 2.

Required the Single Premium for an assurance of £3000 on a life aged 40 for the term of 7 years, reckoning interest at 3 per cent.?

Rule by the D and M columns.

From the quantity in column M at the present age subtract the quantity in the same column at the advanced age, and divide the difference by the quantity in column D at the present age.

In Table 10,

11384.144 = the quantity in column

M, opposite to 40, the
present age.

9732.454 Ditto opposite to 47 the
advanced age,

1651.690 = difference

24111,615 = the quantity in column
D, opposite to 40, the
present age.

Then  $\frac{1651.690}{24111.615} = .0685$ , which, multiplied by 3000 gives £205.5 = £205 10 0, the single premium required.

Rule by the common method.

From the value of an annuity on the life, at the present age, subtract the value of an annuity on the life at the advanced age, multiplied by the present value of £1, due at the end of the term for which the assurance is to continue, and by the probability of the life surviving that term; and multiply the difference thus

obtained by the discount of £1, for one year; then subtract this product from the present value of £1, due at the end of one year, multiplied by unity minus the product of the probability of the life surviving the term, and the present value of £1, due at the end of the term.

In column 3 per cent

14.864 = do. do. 47

In ditto of Table 2, .813092=the present value of £1, at 3 per cent. due at the end of 7 years

Ditto .970874 = do. do. at the end of 1 year.

And 1—970874 = 029126 = discount of £1 at 3 per cent. for one year.

From Table 5 we obtain  $\frac{72582}{78653}$ , the probability of a life aged 40 surviving 7 years.

From which we obtain, according to the rule

$$.970874 \left\{ 1 - \frac{72582}{78653} \times .813092 \right\} - .029126 \left\{ 17.123 - \frac{72582}{78653} \times .813092 \times 14.864 \right\} =$$

$$.24240 - .17388 = .06852.$$

And  $.06852 \times 3000 = £205.5 = £205$  10 as before.

The rule to find the value of a DEFERRED ASSURANCE by the D and M columns is,

Divide the quantity in column M, at the advanced age, by the quantity in column D at the present age.

The above examples in Temporary Annuities, and Assurances, without exhibiting the length of the operations of the multiplications and divisions, are sufficiently illustrative of the superiority of the D and N method. Other examples, much more striking, might be given, but the subject will be found fully illustrated in the treatise on Annuities and Assurances, by D. Jones, published by the Society for the Diffusion of Useful Knowledge, in which will also be found a very extensive collection of formulæ for all cases involving one and two lives.\*

<sup>\*</sup>This Formulæ is contained in No. 7, of the work, price sixpence, which may probably be obtained separately, and as it is printed in octavo, it might with advantage be bound up with the present work.

## LEGAL DECISIONS

ON

## LIFE ASSURANCE:

A DIGEST OF

## ALL THE REPORTED CASES,

CHRONOLOGICALLY ARRANGED.

## Ross versus Bradshaw.

Trinity Term, 1761.

Concealment of circumstances on a life insurance is not so fatal if the life be warranted good, as if it be a common insurance. "Where there is a warranty, then nothing need be told; but it must in general be proved, if litigated, that the life was in fact a good one, and so it may be though he have a particular infirmity. The only question is, whether he was in a reasonably good state of health, and such a life as ought to be insured on common terms."---LORD MANSFIELD. 1. W. Black. 312. See also on this point, Willis versus Poole. 2 Park on Ins. 935.

## STACKPOLE versus SIMON.

Hilary Vac. 1779.

Where a Broker, who effected an insurance, told the Underwriters that the person for whom he acted would not warrant, but he believed the party to be a good life, Held, that the Underwriters were liable. 2 Park on Ins. 932.

## PATTERSON versus BLACK.

Hilary Vac. 1780.

Where an insurance is made upon the life of a man who goes to sea, and the ship in which he sailed is never afterwards heard of, the question

whether he did or did not die within the term insured, is a fact for the Jury to ascertain from the circumstances which shall be produced in evidence before them. 2 Park on Ins. 920.

## LOCKYER versus OFFLEY.

26th May, 1786.

On an Insurance on a man's life for a year, if, some short time before the expiration of the term, he receives a mortal wound, of which he dies after the year, the insurer will not be liable.—1. T. R. 260.—A supposed case by Willes, J.

## DWYER versus Edie.

Hilary Term, 1788.

The holder of a note given for money won at play, has not an insurable interest in the life of the maker of the note. 2 Park on Ins. 914.

## TIDSWELL versus Ankerstein.

18th July, 1792.

An executor in trust has a sufficient interest to enable him to make assurance in his own name, on the life of a person who has granted an annuity to the testator. *Peake's N.P.* 204.

## ANDERSON versus Edie.

Trinity Term, 1795.

A bona fide creditor has such an interest in his debtor's life, that he may insure it and recover upon the policy. 2 Park on Ins. 915.

## AVESON versus LORD KINNAIRD, AND OTHERS.

6th Feb. 1805.

In an action by the husband upon a policy of insurance on the life of his wife, declarations by his wife, made by her when lying in bed, apparently ill, stating the bad state of her health at the period of her going to M. (whither she went a few days before in order to be examined by a surgeon, and to get a certificate from him of good health, preparatory to making the insurance) down to that time, and her apprehensions that she could not live ten days longer, by which time the policy was to be returned, are admissible in evidence to shew her own opinion, who best knew the fact of the ill state of her health at the time of effecting the policy, which was on a day intervening between the

time of her going to M. and the day on which such declarations were made; and particularly after the plaintiff had called the surgeon as a witness to prove that she was in a good state of health when examined by him at M., this judgment being formed, in part, from the satisfactory answers given by her to his enquiries. 6 East, 188.

Holland, Executor of O'Hara, versus Smith, Executor of Kendrick.

4th March, 1806.

Where a policy of insurance has been effected on the life of a debtor, as a security to the lender of money, and the lender charges the premiums to the account of the debtor, who pays them, if the principal is afterwards paid, the debtor, or his representative, is entitled to the policy. 6 Esp. 11.

Godsall and others, versus Boldero and others, Directors of the Pelican Life Insurance Company.

25th Nov. 1807.

A Creditor may insure the life of his Debtor to the extent of his debt; but such a contract is substantially a contract of indemnity against the loss of the debt; and therefore, if, after the death of the debtor, his executors pay the debt to the insuring creditor, the latter cannot afterwards recover upon the policy; although the debtor died insolvent, and the executors were furnished with the means of payment by a third party.—9 East, 72.

Want and others, versus Blunt and others, Directors of a Life Assurance Society for the benefit of Widows and Female Relatives.

12th Feb. 1810.

Where one, as a member of a Life Insurance Society for the benefit of widows and female relatives, entered into a Policy of Insurance with the society for a certain annuity to his widow after his death, in consideration of a quarterly premium to be paid to the Society during his life, and the Society covenanted with him and his executors, &c., that if he should pay to their clerk the quarterly premiums on the quarterdays during his life, and if he should also pay his proportion of contributions, which the members of the Society should, during his life, be called on to make, in order to supply any deficiences in their funds, then, on due proof of his death, the Society engaged to pay the annuity to his widow; and by the rules of the Society, if any member neglected to

pay up the quarterly premiums for fifteen days after they were due, the policy was declared to be void, unless the member (continuing in as good health as when the policy expired) pay up the arrears within six months, and five shillings per month extra:—Held, that a member insuring, having died, leaving a quarterly payment over-due at the time of his death, the policy expired; and that a tender of the sum by the member's executor, though made within fifteen days after it became due, did not satisfy the requisition of the policy and the rules of the Society which required such payment to be made by the member in his lifetime, continuing in as good health as when the policy expired.—12 East, 183.

Watson versus Mainwaring and others, Directors of the Equitable
Insurance Office.

6th May, 1813.

It is not to be concluded that a disorder with which a person is afflicted before he effects an insurance on his life is a "disorder tending to shorten life," within the meaning of the declaration required by the Equitable Insurance Office, from the mere circumstance that he afterwards dies of it, if it be not a disorder which generally has that tendency.—4 Taunt. 763.

Huguenin versus Rayley—the Albion Insurance Company.

6th May, 1815.

The conditions of a life insurance required a declaration of the state of the health of the assured, and the policy was to be valid only if the statement were to be free from all misrepresentation and reservation: the declaration described the assured as resident at Fisherton Anger; she was then a prisoner in the county gaol there:—Held, that it was a question for the Jury whether the imprisonment were a material fact, and ought to have been communicated.—6 Taunt., 186.

## HIGGINS versus SARGENT and others.

Nov. 1823.

Interest is not recoverable in an action of covenant upon a policy of Assurance upon the life of A., by which a certain sum was made payable six months after due proof of his death, although the money insured was not paid at the time stipulated for that purpose.—3 D. § R. 613. 2 B. § C. 348.

## MAYNARD versus RHODES.

8th Nov. 1824.

Where an insurance was effected on the life of A. for the benefit of B., and the Insurance Office acted upon A.'s own representation as to the state of his health, and it turned out that he was not an insurable life:— Held, that B. could not maintain an action on the policy, although he was not privy to the representation. 5 Dowl. and Ryl. 266, 1 C. and P. 360.

## MORRISON versus MUSTPRATT.

31st January, 1827.

A female upon whose life it was proposed to effect an insurance was represented to the insurers, in December, 1822, by A., a medical man, as enjoying, ordinarily, a good state of health. The same representation was repeated by A. in March, and the insurance was effected in April, 1823. Between December, 1822, and March, 1823, she had been ill with a pulmonary attack, and was attended by B.; but no disclosure of these circumstances was made to the insurers. In April, 1824, she died of a pulmonary disease:—Held, on motion for a new trial, that the Jury ought to have been called on to consider whether the illness in 1823, and the attendance of B., ought to have been disclosed to the insurers; and that it was not sufficient to direct them generally to consider whether or not there had been any misrepresentation.—4 Bing. 60. 12 Moore, 231.

## BOLLAND versus DISNEY, the Amicable Assurance Society.

21st May, 1827.

In the policies effected by the Amicable Society, there is no exception as to death by the hands of justice. A person insuring his life in that office afterwards suffered death for a criminal offence, the policy was not thereby avoided. 3 Russ. 351. But see The Amicable Society App. Bolland and others. Resp. page 6.

LINDENAU versus Desborough, Secretary to the Atlas Insurance Company.

12th Nov. 1828.

If the assured, at the time of effecting the policy, conceals anything material for the plaintiff to know, the policy is void; and it matters not whether or not the assured considered it material or not; and what

amounts to a misrepresentation, or to a material concealment, is a question for the Jury; the fact that, on a life policy, an unusually high premium was paid, is quite immaterial, and therefore not to be taken as a proof that the Office considered the party to be a bad life.—3 M. & R., 45. 8 B. & C. 586. 3 C. & P. 350.

## EVERETT versus Desborough, Secretary to the Atlas Insurance Company.

27th May, 1829.

1.—In an insurance upon the life of another, the life insured, if applied to for information, is, in giving such information, impliedly the Agent of the party insuring, who is bound by his statements, and must suffer if they are false, although he is unacquainted with the life insured, and the servant of the Insurance Office undertakes to do all that is required by his Office. 2.—Plaintiff effected an insurance on the life of H, with whom he was unacquainted, desired the Agent of the Insurance Office to do all that was requisite. The Agent knew H well, and made the usual inquiries. One of the terms of the contract was, a reference to the usual Medical Attendant of the life insured. H. having given a false reference: Held, that the Plaintiff could not recover.—5 Bing. 503. M. and P. 190.

The Amicable Society Appellants, James Bolland and others, Respondents.

1830.

H. F. assures his life in January, 1815, and pays premiums regulary till 1824. In June, 1815, H. F. commits a felony, of which he is convicted in October, 1824, and for which he is executed in Nov. 1824. Bill filed in 1825, by the representatives of H. F., claiming under him and in his right, for payment of the sum alleged to be due on the Insurance, and decree in favour of the representatives; but the judgment reversed by the Lords, on the ground, that, by the general policy of the law, the insurance became void as to those claiming under and in right of H. F., in consequence of the death being occasioned by his own criminal act. 2 Dow and Clark, 1. 4 Bligh, N. S. 194.

RICHARD HALFORD versus Kymer and others, Directors of the Asylum Life Insurance Company.

4th May, 1830.

The stat. 14 Geo. 3, c. 48, s. 1, enacts that no insurance shall be

made on lives, or any other event, wherein the person for whose benefit the policy shall be made shall have no interest; and that every such assurance shall be void: and by s. 3, it is enacted that in all cases where the insured hath interest in such life or event, no greater sum shall be recovered or received from the insurers than the amount or value of the interest of the insured in such life or other event. In order to render a policy valid within the meaning of this Act, the party for whose benefit it is effected must have a pecuniary interest in the life or event insured; and therefore a policy effected by a father on the life of his son, he not having any pecuniary interest therein, is void.—10 B. and C. 724.

## J. G. S. Lefevre and others, Trustees of the Promoter Life Assurance Company, versus Boyle.

13th January, 1832.

A policy was effected by A. upon her own life with an Insurance Company: it was by deed, executed by three Trustees of the Company: A. afterwards assigned it to B. and died. The money due on the policy was paid to B. by a check drawn by the Trustees on the Bankers of the Company, and he gave an acknowledgment of having received the money from the Trustees. By the deed of trust the Board of Directors were to cause all monies belonging to the Company to be deposited with the Bankers in the name of the Trustees, and such monies were not to be withdrawn but for the purposes of the Company, and by checks signed by the Trustees, or by three or more Directors under some authority to be given by the Trustees. After the payment to B. it was discovered that the policy was void on account of fraud:—Held, that, under the circumstances, the three Trustees were the proper plaintiffs in an action to recover back the money so paid to B.—3 B. § Add. 877.

Swete versus Fairlie, and another,—the Globe Insurance Office.

28th Feb, 1833.

A policy of insurance on the life of another person, who, at the time of the insurance, is in a good state of health, is not vitiated by the non-communication by such person of the fact of his having, a few years before, been afflicted with a disorder tending to shorten life, if it appear that the disorder was of such a character as to prevent the party from being conscious of what had happened to him while suffering under it.  $6 \ C \cdot and \ P \cdot 1$ .

Duckett—the Provident Life Assurance Company—versus Williams
—the Hope Insurance Company.

Hilary Term, 1834.

Before effecting a policy of life insurance, a declaration and statement of health, and freedom from disease, &c., was signed by the assured. By one clause it was stipulated that "if any untrue averment was contained therein, or if the facts required to be set forth in the above proposal were not truly stated," the premiums were to be forfeited, and the assurance to be void. Held, that as the health, &c. of the party whose life was insured was untruly stated, though not to the knowledge of the party making the declaration and statement, the premiums, &c. were forfeited, and could not be recovered back. 2 Cromp. and Mees. 348 4 Tyr. 240.

Wainwright, Executor of Abercromby, deceased, versus Bland and others, three of the Directors of the Imperial Life Assurance Company.

27th June, 1835.

A party, on insuring her life, made false representations as to her object in effecting the insurance, and also as to her having obtained similar insurances from other offices, both of which facts were found by the Jury at the trial to be material to be known by the Insurance Company.—Held, that the policy was thereby avoided, although such false representations were in answer to parol inquiries not comprised in the list of printed questions required by the regulations of the Office to be asked of the assured; and although the policy, as framed, was only to be void on false answers being given to such printed questions.—1 Tyr. & Gr. 417. 1 Moody and Rob. 481.

Chattock versus Shawe and others, Directors of the Eagle Insurance Company.

11th July, 1835.

Where a policy of insurance contains a warranty that the assured "has not been afflicted with, nor subject to, gout, vertigo, fits," &c. such warranty is not broken by the fact of the assured having had an epileptic fit in consequence of an accident. To vacate such policy it must be shown that the constitution of the assured was naturally liable to fits, or by accident or otherwise had become so liable.—1 Moody & Rob. 498.

Huckman versus Fernie, Managing Director of the British
Commercial Insurance Company.

Easter Term, 1838.

In an action on a Policy of Insurance effected by the plaintiff on the life of his wife, the declaration averred that the plaintiff had made statements (inter alia) that the wife was not afflicted with any disorder which tended to shorten life, and that she had led, and continued to lead, a temperate life. The defendant pleaded, that before the making of the policy, and on divers times after that day, the wife had been, and was afflicted with certain disorders, maladies or diseases-to wit, delirium tremens and erysipelatous inflammation of the legs, all which the plaintiff before, and at the time of making the policy, well knew. It appeared that at the time the policy was effected, the wife had been examined at the Insurance Office, and answered several questions put to her, but did not apprise the Company of her having been affected with those complaints. The Jury found that the plaintiff had not any knowledge of her having had these disorders:-Held, that upon the issue raised on these pleadings, the wife not being the general agent of the husband to effect the policy, but only sent to answer particular questions, her knowledge was not in this respect the knowledge of the husband. The wife had for several years been attended by A. B. up to her marriage with the plaintiff, and nearly to the time the policy was effected. After her marriage C. D., the medical attender of her husband's family, prescribed for her for a cold, or some trifling matter. answer to the question put to her at the Office, "who is your usual medical attendant," she replied, C. D.:-Held, that the learned Judge ought not to have left it to the Jury, on this evidence, to say which of the two was her usual medical attendant, but whether C. D. could be called her usual medical attendant at all. 3 Meeson & Welsby, 505.

Rawlins, a Director of the Eagle Insurance Company, versus Desborough, Secretary to the Atlas Assurance Company.

26th Feb. 1840.

1. A party whose life is insured, is not the general agent for the assured: and therefore the policy is not void by reason that such party failed to communicate a material fact, as to which he was not interrogated by the insurers, unless he was aware of the materiality of the fact and

studiously concealed it. 2. It is a question of fact for the Jury whether a fact, not communicated, was, under the circumstances, one which the assured ought to have communicated.—2 Moody & Rob. 328.

Craig, Bart. versus Fenn and others—the Asylum Life Insurance Company.

16th Dec. 1841.

In an action against an Insurance Office on a life policy, it is no objection to a Special Juror being sworn, that he is a director of another insurance office, unless that office has granted a policy on the life in question, and the amount of that policy be unpaid. 1 Carr and Marsh 43.

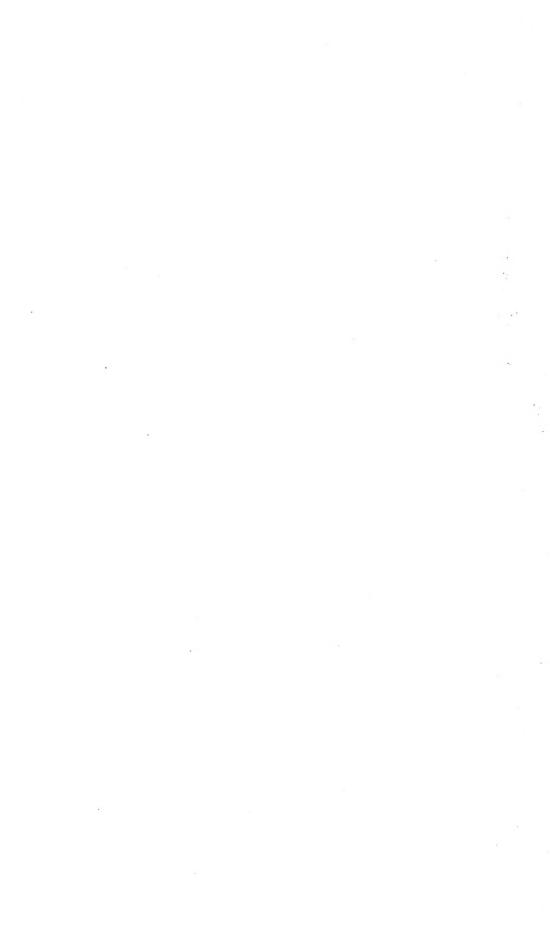

17th March, 1842.

In an action to recover the amount of a policy upon a life insurance, where the rules of the society stipulate that the insured shall be of sober and temperate habits, it is sufficient, on a plea denying the sober and temperate habits of the insured, for the defendants to shew that his habits were intemperate; and it is no answer to this plea, that the plaintiff prove the intemperance not to have been to such a degree as to injure the health of the insured, or to shorten his life. 1 Carr and Mar. 286.
